COS 217: Introduction to Programming Systems

Fall 2005 (TTh 10:00-10:50 in CS 105)
Jennifer Rexford
Preceptors: Bob Dondero and Chris DeCoro

http://www.cs.princeton.edu/courses/archive/fall05/cos217/
Goals for Today’s Class

• COS 217 overview
  – Goals of the course
  – Learning the material
  – Programming environment
  – Writing good software
  – Course grading
  – Academic policies

• Getting started in C
  – How C differs from Java
  – Getting input and providing output

http://www.cs.princeton.edu/courses/archive/fall05/cos217/
Goals of COS 217

• Understand boundary between code and computer
  – Machine architecture
  – Operating systems
  – Compilers

• Learn C and the Unix development tools
  – C is widely used for programming low-level systems
  – Unix has a rich development environment
  – Unix is open and well-specified, good for study & research

• Improve your programming skills
  – More experience in programming
  – Challenging and interesting programming assignments
  – Emphasis on modularity and debugging
Learning the Material: People

• Lecture (Jennifer Rexford)
  – Goal: Introduce concepts, and work through examples
  – When: TTh 10:00-10:50 in CS 105
  – Slides available online at course Web site

• Precept (Bob Dondero and Chris DeCoro; start next week!)
  – Goal: Demonstrate tools and work through programming examples
  – When: MW 1:30-2:20pm, TTh 1:30-2:20pm, and ???
  – Candidate times for the extra precept (vote!)
    • MW 12:30-1:20pm
    • MW 3:30-4:20pm
    • TTh 12:30-1:20pm
    • TTh 3:30-4:20pm

• Lab TAs in the Friend Center 016/017

• Listserv at cos217@lists.cs.princeton.edu
Contacting Us

• Jennifer Rexford
  – Room 306 in Computer Science Building
  – E-mail at jrex@cs.princeton.edu
  – Phone: e-mail is better

• Bob Dondero
  – Room 206 in Computer Science Building
  – E-mail at rdondero@cs.princeton.edu
  – Phone at 609-258-2211

• Chris DeCoro
  – Room 103B in Computer Science Building
  – E-mail at cdecoro@cs.princeton.edu
  – Phone at 609-258-1746

• Office hours: pending resolution of precept times
Learning the Material: Books

• Required textbooks

• Highly recommended

• Optional (available online)
  – *IA32 Intel Architecture Software Developer's Manual, Volumes 1-3*
  – *Tool Interface Standard & Executable and Linking Format*
  – *Using as, the GNU Assembler*

• Other textbooks (on reserve in the Engineering Library)
  – *C Interfaces and Implementations*, Hanson, 1996.
Learning the Material: Writing Code

- A “de-comment” program
- A string module
- A symbol table abstract data type (ADT)
- A heap manager
- UNIX commands in AI-32 assembly language
- A buffer overrun attack
- An execution profiler
Facilities for Programming

• **Recommended options: OIT “hats” LINUX cluster**
  – Friend Center 016 or 017 computer, secure shell to “hats”, or
  – Your own PC, secure shell to “hats” (Linux)
  – Why: common environment, and access to lab TAs

• **Other option: on your own PC (not recommended; reasonable only for some parts of some assignments):**
  – Running GNU tools on Linux, or
  – Running GNU tools on Windows, or
  – Running a standard C development environment

• **Assignments are due Sundays at 9:00pm**

• **Advice: start early, to allow time for debugging (especially in the background while you are doing other things!)…**
Why Debugging is Necessary...
Software in COS126

1 Person
$10^2$ Lines of Code
1 Type of Machine
0 Modifications
1 Week
Software in the Real World

Specifying
Design
Programming
Debugging
Testing

Lots of People
$10^6$ Lines of Code
Lots of Machines
Lots of Modifications
1 Decade or more
Good Software is Modularized

- **Understandable**
  - Well-designed
  - Consistent
  - Documented

- **Robust**
  - Works for any input
  - Tested

- **Reusable**
  - Components

- ** Efficient**
  - Only matters for 1%

Write code in **modules** with well-defined interfaces
Write code in **modules** and test them separately
Write code in **modules** that can be used elsewhere
Write code in **modules** and optimize the slow ones
Grading

• Seven programming assignments (60%)
  – Working code
  – Clean, readable, maintainable code
  – On time (penalties for late submission)

• Exams (30%)
  – Midterm
  – Final

• Class participation (10%)
  – Precept attendance is mandatory
Programming in an individual creative process much like composition. You must reach your own understanding of the problem and discover a path to its solution. During this time, discussions with friends are encouraged. However, when the time comes to write code that solves the problem, such discussions are no longer appropriate - the program must be your own work. If you have a question about how to use some feature of C, UNIX, etc., you can certainly ask your friends or the teaching assistants, but do not, under any circumstances, copy another person's program. Letting someone copy your program or using someone else's code in any form is a violation of academic regulations. "Using someone else's code" includes using solutions or partial solutions to assignments provided by commercial web sites, instructors, preceptors, teaching assistants, friends, or students from any previous offering of this course or any other course.
Any questions before we start talking about C?
Oh Say Can You C

• “C has always been a language that never attempts to tie a programmer down.”

• “C has always appealed to systems programmers who like the terse, concise manner in which powerful expressions can be coded.”

• “C allowed programmers to (while sacrificing portability) have direct access to many machine-level features that would otherwise require the use of Assembly Language.”

• “C is quirky, flawed, and an enormous success. While accidents of history surely helped, it evidently satisfied a need for a system implementation language efficient enough to displace assembly language, yet sufficiently abstract and fluent to describe algorithms and interactions in a wide variety of environments.” – Dennis Ritchie
The C Programming Language

• **Systems programming language**
  – Originally used to write Unix and Unix tools
  – Data types and control structures close to most machines
  – Now also a popular application programming language

• **Pros and cons**
  – Can do whatever you want: flexible and efficient
  – Can do whatever you want: can shoot yourself in the foot

• **Notable features**
  – All functions are call-by-value
  – Pointer (address) arithmetic
  – Simple scope structure
  – I/O and memory management facilities provided by libraries

• **History**
  – BCPL → B → C → K&R C → ANSI C
  – LISP → Smalltalk → C++ → Java
Java vs. C

• Abstraction
  – C exposes the raw machine
  – Java hides a lot of it

• Bad things you can do in C that you can’t do in Java
  – Shoot yourself in the foot (safety)
  – Others shoot you in the foot (security)
  – Ignoring wounds (error handling)

• Dangerous things you must do in C that you don’t in Java
  – Memory management (i.e., malloc and free)

• Good things that you can do in C, but Java makes you
  – Objected-oriented methodology

• Good things that you can’t do in C but you can in Java
  – Portability
## Java vs. C

<table>
<thead>
<tr>
<th>Program</th>
<th>Java</th>
<th>C</th>

</tbody>
</table>
Standard Input/Output

- Three standard I/O streams
  - In: stdin
  - Out (normal): stdout
  - Out (errors): stderr

- Binding
  - Flexible/dynamic binding of streams to actual devices or files
  - Default binding
    - stdin bound to keyboard
    - stdout and stderr bound to the terminal screen
Standard I/O in C

• Three standard I/O streams
  – stdin
  – stdout
  – stderr

• Basic calls for standard I/O
  – int getchar(void);
  – int putchar(int c);
  – int puts(const char *s);
  – char *gets(char *s);

• Use “man” pages
  % man getchar

```c
#include <stdio.h>

main() {
    int c;
    c = getchar();
    while (c != EOF) {
        putchar(c);
        c = getchar();
    }
}
```

% a.out < file1 > file2
% a.out < file1 | a.out > file2
% a.out < file1 | a.out | a.out > file2
Pipes Connect Output to Input

% a.out < file1 | a.out > file2
What’s all this good for?

• In the old days…
  – Programmers hard-coded input/output devices into programs
  – Hard to program, and hard to port to different I/O devices

• Along came OS-360 (1964)
  – Separate I/O device driver (in OS) from data (in program)
  – A good early example of modularity and data abstraction
  – However, still clumsy to connect output of one program to input of another
What’s all this good for?

- **Unix (early 1970s)**
  - First OS to have standard I/O redirection and pipes

- **Standard I/O redirection**
  - Write program once
  - Same program can be made to work for different input/output devices at run time

- **Good practice of modularity**
What’s all this good for?

- **Pipes**
  - Write small programs that specialize in very simple tasks
  - Connect lots of smaller programs to make bigger programs
  - Makes bigger programs easier to write
  - Earliest and best success story of programming with components

- **Standard I/O redirection & pipes: big part of Unix success**

- **Good practice of modularity is a learned art**
Formatted Output: printf

- `int printf(char *format, ...);`
  - Translate arguments into characters according to “format”
  - Output the formatted string to stdout

- **Conversions (read “man printf” for more)**
  - `%d` – integer
  - `%f` – float
  - `%lf` – double
  - `%3f` – float with 3 decimal places
  - `%%%` – percent

- **Examples**
  - `int i = 217;`
    - `printf(“Course number is: %d”, i );`
Formatted Input: scanf

- `int scanf(const char *format, ...);`
  - Read characters from stdin
  - Interpret them according to “format” and put them into the arguments

- **Conversions (read “man scanf” for more)**
  - `%d` – integer
  - `%f` – float
  - `%Lf` – double
  - `%%` – literal %

- **Example**
  - `double v;`
    `scanf( "%lf", &v );`
  - `int day, month, year;`
    `scanf( "%d/%d/%d", &month, &day, &year );`
• **stderr** is the second output stream for output errors

• **Some functions to use stderr**
  – `int fprintf(FILE *stream, const char *format, ...);`
    • Same as `printf` except the file stream
  – `int fputc(int c, FILE *stream);`
    • `putc()` is the same as `fputc()`
  – `int fgetc(FILE *stream);`
    • `getc()` is the same as `fgetc()`

• **Example**
  – `fprintf( stderr, "This is an error.\n" );`
  – `fprintf( stdout, "This is correct.\n" );`
  – `printf( "This is correct.\n" );`
Example

```c
#include <stdio.h>

const float KMETERS_PER_MILE = 1.609;

int main(void) {
    int miles;
    float kmeters;

    printf("miles: ");
    if ( scanf("%d", &miles) != 1 ) {
        fprintf( stderr, "Error: Expect a number.\n" );
        exit(1);
    }

    kmeters = miles * KMETERS_PER_MILE;
    printf("= %f kilometers.\n", kmeters );
}
```
Summary

• The goal of this course:
  – Master the art of programming
  – Learn C and assembly languages for systems programming
  – Introduction to computer systems

• It is easy to learn C if you already know Java
  – C is not object oriented, but many structures are similar
  – Standard I/O functions are quite different from Java’s input and output

• Next lecture
  – Character input and output

http://www.cs.princeton.edu/courses/archive/fall05/cos217/
