

COS 425:  
Database and Information  
Management Systems

## Relational model

---

---

---

---

---

---

---

---

## Relational model

- A **formal** (mathematical) model to represent
  - objects (data/information),
  - relationships between objects
  - Constraints on objects and relationships
  - Queries about information
  
- **Well-founded** on **mathematical principles** :
  - Precise **semantics** of constraints and queries
  - Can **prove equivalence** of different ways to express queries

---

---

---

---

---

---

---

---

## Relational model - practice

- **Foundation** of most Database Management Systems
  
- **SQL** language is a **programming language** to express constructs of formal model

---

---

---

---

---

---

---

---

## Relational Database Definitions

1. A **relation** is a set of tuples over specified domains
  - R subset of  $D_1 \times D_2 \times D_3 \times \dots \times D_k$  (k-ary)
  - Each  $D_i$  is a declared domain
2. A **relational database** is a **set of relations** and possibly **constraints among the relations**

---

---

---

---

---

---

---

---

## Relational Database: Terminology

Schema for a relation:

1. Relation **name**
2. **Domain (type) of each component**  
i.e. declare  $D_i$ s

Equivalent:

- Instance of a schema
- Table

Term "**relation**" is used to refer to a schema and a particular instance – disambiguate by context

---

---

---

---

---

---

---

---

## Relational Database: More Terminology

Each  $D_i$  of a schema is referred to as a **component** or **attribute** or **field** or **column** of the schema

Each  $d_i$  of a tuple =  $(d_1, d_2, d_3, \dots, d_k)$  is referred to as **component** or **attribute** or **field** of the tuple

Each **tuple** of a relation is also referred to as an **element** or **row** of the relation

---

---

---

---

---

---

---

---

## Translating ER model to relational

- Domains → domains
- Entity → relation
- Relationship → one\* or more relations  
\* come back to
- Constraints → constraints BUT
  - Not all ER constraints expressible in basic relational model

Relational model is FLAT – no hierarchy!

---

---

---

---

---

---

---

---

## Our ER Example → Relational schema

For entities, get relations:

*books*: (title, ISBN#, edition, date)

*authors*:

(name, gender, birth date, place of birth, date of death)

*publishers*: (name, country, address)

Need declare domains:

e.g. title: string

Same defs candidate keys, primary key, superkeys

---

---

---

---

---

---

---

---

## Our ER Example → Relational schema

For relationships:

ER *published by*: (*books*, *publishers*, in print)

becomes

*published by*: (isbn#, publisher\_name, in print)

ER *written by*: (*books*, *authors*)

becomes

*written by*:

(isbn#, author\_name, birth date, place of birth)

Keys for these?

---

---

---

---

---

---

---

---

**Our ER Example → Relational schema**

For relationships:

ER *published by*: (**books**, **publishers**, in print)  
becomes

*published by*: (isbn#, publisher\_name, in print)  
key constraint on entity *books* in relationship *published by* →  
A book has at most one publisher

ER *written by*: (**books**, **authors**)  
becomes

*written by*:  
(isbn#, author\_name, birth\_date, place\_of\_birth)

---

---

---

---

---

---

---

---

**Our ER Example → Relational schema**

Because ER key constraint on entity *books* in  
relationship *published by*  
Can fold relation *published by* into relation *books*:

*books*:  
(title, ISBN#, edition, date, pub\_name, in print)

What if some books not published?  
i.e. entity *books* not totally participate in relationship  
*published by*

---

---

---

---

---

---

---

---

**Our ER Example → Relational schema**

*books*:  
(title, ISBN#, edition, date, pub\_name, in print)

What if some books not published?  
i.e. entity *books* not totally participate in relationship *published by*

Must allow values  
of attributes *pub\_name* and *in print* to be null

---

---

---

---

---

---

---

---

## Translating ER model to relational

General conclusion:

Relationship → one zero or more relations

---

---

---

---

---

---

---

---

## Translating ER model to relational

- Get flat set of relations
- But relations are interrelated
  - Bring together primary keys of different relations to build new relation
  - Captures ER relationship
- How capture this in relational model?  
Foreign key constraints

---

---

---

---

---

---

---

---

## Foreign key constraint

- Specify that a set of attributes in schema for one relation form the primary key for a specific other relation
  - “other relation” is referred to or referenced by first relation

R1: (attrib1, attrib2, attrib3, attrib4, attrib5)

R1 refers to/references R2

R2: (attrib1, attrib2, attrib3, attrib4)

---

---

---

---

---

---

---

---

### Foreign Keys for Our Example

published by: (isbn#, publisher\_name, in print)

isbn# is a foreign key referencing books

Primary key of books understood

Publisher\_name is a foreign key referencing publishers

written by:

(isbn#, author\_name, birth\_date, place of birth)

isbn# is a foreign key referencing books;

(author\_name, birth\_date, place of birth) is a foreign key referencing authors

---

---

---

---

---

---

---

---

### Board Examples

---

---

---

---

---

---

---

---
