## Undirected graph

Graph. Set of vertices connected pairwise by edges.

Why study graph algorithms?

- Interesting and broadly useful abstraction.
- Challenging branch of computer science and discrete math.
- Hundreds of graph algorithms known.
- Thousands of practical applications.

Power transmission grid of Western US

The Internet

Graph terminology

## Path. Is there a path between $s$ to $\dagger$ ?

Shortest path. What is the shortest path between sand t?
Longest path. What is the longest simple path between $s$ and $t$ ?
Cycle. Is there a cycle in the graph?
Euler tour. Is there a cycle that uses each edge exactly once?
Hamilton tour. Is there a cycle that uses each vertex exactly once?
Connectivity. Is there a way to connect all of the vertices?
MST. What is the best way to connect all of the vertices?
Biconnectivity. Is there a vertex whose removal disconnects the graph?

Planarity. Can you draw the graph in the plane with no crossing edges?

First challenge: Which of these problems is easy? difficult? intractable?

breadth-first search
connected component
challenges

## Graph representation

Vertex representation.

- This lecture: use integers between 0 and $\mathrm{v}-1$.
- Real world: convert between names and integers with symbol table.

Other issues. Parallel edges, self-loops.

## Graph API

## public class Graph (graph data type)

Graph (int V)
d addEdge(int $v$, int $w$ )
Iterable<Integer> adj(int v)
int V()
String toString()

Client that iterates through all edges
Graph G = new Graph (V, E) StdOut.println(G);
for (int $v=0 ; \mathrm{v}<\mathrm{G} . \mathrm{V}() ; \mathrm{v}++$ ) or (int w : G.adj(v)) // process edge v-w
create an empty graph with $\vee$ vertices create a random graph with $\vee$ vertices, $E$ edges add an edge v -w
return an iterator over the neighbors of $v$
return number of vertices return a string representation

Set of edges representation

Store a list of the edges (linked list or array)

Adjacency-matrix graph representation: Java implementation

```
public class Graph
l private int V;
    private int V;
    public Graph(int v)
        this.v = v;
        adj = new boolean[V][V]: «% <
    }
    public void addEdge(int v, int w)
        {\mp@code{adj[v][w] = true;}}\begin{array}{l}{\operatorname{adj[v][w]}[v] = true; }
    }
    public Iterable<Integer> adj(int v)
    return new AdjIterator(v); «_ iterator for
    }
}
```

Adjacency-list graph representation

Maintain vertex-indexed array of lists (implementation omitted)

$0: \quad 5 \longmapsto 2 \longleftrightarrow 1 \longleftrightarrow 6$ -
1: 0. two entries

$0 \longmapsto 4 \longleftrightarrow 3$ -
$4 \longrightarrow 0$ •
8 •
: 7 •
$10 \longleftrightarrow 11 \longleftrightarrow 12$ •
9 •
$9 \longleftrightarrow 12$ •
$9 \longrightarrow 11$ •

## Adjacency-SET graph representation: Java implementation

Adjacency-SET graph representation

Maintain vertex-indexed array of SETs
(take advantage of balanced-tree or hashing implementations)

## Graph representations

Graphs are abstract mathematical objects, BUT

- ADT implementation requires specific representation.
- Efficiency depends on matching algorithms to representations.

## Maze exploration

Maze graphs.

- Vertex = intersections.
- Edge = passage.

Goal. Explore every passage in the maze.

## Trémaux Maze Exploration

## Trémaux maze exploration.

- Unroll a ball of string behind you.
- Mark each visited intersection by turning on a light.
- Mark each visited passage by opening a door.

First use? Theseus entered labyrinth to kill the monstrous Minotaur; Ariadne held ball of string.

Claude Shannon (with Theseus mouse)

Graph-processing challenge 1:
Problem: Flood fill
Assumptions: picture has millions to billions of pixels

How difficult?

1) any COS126 student could do it
2) need to be a typical diligent COS226 student
3) hire an expert
4) intractable
5) no one knows

Depth-first search

## Goal. Systematically search through a graph

Idea. Mimic maze exploration.
Typical applications

- find all vertices connected to a given s
- find a path from s to $t$

## DFS (to visit a vertex s)

## Mark sas visited.

Visit all unmarked vertices v adjacent to s .

Running time.

- $O(E)$ since each edge examined at most twice
- usually less than $V$ to find paths in real graphs

## Design pattern for graph processing

Typical client program.

- Create a Graph.
- Pass the Graph to a graph-processing routine, e.g., DFSearcher.
- Query the graph-processing routine for information.

```
Client that prints all vertices connected to (reachable from)s
public static void main(String[] args)
    In in = new In(args[0]);
    Graph G = new Graph(in);
    int s = din dfs = new DFSearcher (G, s)
    for (int v = 0; v < G.v(); v++)
            System.out.println(v)
}
```

Decouple graph from graph processing.

## Connectivity application: Flood fill

Change color of entire blob of neighboring red pixels to blue.
Build a grid graph

- vertex: pixel.
- edge: between two adjacent lime pixels.
- blob: all pixels connected to given pixel.

client can ask whether any vertex is
connected to $s$
\}

Connectivity Application: Flood Fill

Change color of entire blob of neighboring red pixels to blue.

Build a grid graph

- vertex: pixel.
- edge: between two adjacent red pixels.
- blob: all pixels connected to given pixel.

33

## Graph-processing challenge 3:

Problem: Find a path from s to t.
Assumptions: any path will do

How difficult?

1) any CS126 student could do it
2) need to be a typical diligent CS226 student
3) hire an expert
4) intractable
5) no one knows

## Graph-processing challenge 2

## Problem: Is there a path from s to t?

How difficult?

1) any CS126 student could do it
2) need to be a typical diligent CS226 student

3) hire an expert
4) intractable
5) no one knows

## Paths in graphs

Is there a path from s to $t$ ? If so, find one.

Paths in graph
Is there a path from $s$ to $t$ ?

| method | preprocess time | query time | space |
| :---: | :---: | :---: | :---: |
| Union Find | $V+E \log ^{\star} V$ | $\log ^{*} V+$ | $V$ |
| DFS | $E+V$ | 1 | $E+V$ |
|  |  | + amortized |  |
|  |  |  |  |

If so, find one.

- Union-Find: no help (use DFS on connected subgraph)
- DFS: easy (stay tuned)

UF advantage. Can intermix queries and edge insertions.
DFS advantage. Can recover path itself in time proportional to its length.

## Depth-first-search (pathfinding)

```
public class DFSearcher
{
    private int[] pred;\longleftarrow
    public DFSearcher(Graph G, int s) of DFS tree
    pub
        Mred = new int[G.V()];
            pred[v] = -1;
    }
    private void dfs(Graph G, int v)
        marked[v] = true;
        marked[v] = true;
            if (!marked[w])
            if
                pred[w] = v; «
            dfs(G, w);
        }
    public Iterable<Integer> path(int v) }\longleftarrow\quad\begin{array}{c}{\mathrm{ add method for client}}
}
```

## Keeping track of paths with DFS

DFS tree. Upon visiting a vertex v for the first time, remember that you came from pred[v] (parent-link representation).

Retrace path. To find path between $s$ and $v$, follow pred back from $v$.

©

## Depth-first-search (pathfinding iterator)

## public Iterable<Integer> path(int v)

Stack<Integer> path $=$ new Stack<Integer>() ; while (v !=-1 \&\& marked[v])

1
list.push(v) ;
v = pred[v];
\}
return path;
\}
\}

## DFS summary

Enables direct solution of simple graph problems.

- Find path from s to $t$. $\quad \checkmark$
- Connected components (stay tuned).
- Euler tour (see book)
- Cycle detection (simple exercise).
- Bipartiteness checking (see book).

Basis for solving more difficult graph problems

- Biconnected components (see book).
- Planarity testing (beyond scope)

## Breadth-first search scaffolding

public class BFSearcher

Breadth-first search. Put unvisited vertices on a queue
Shortest path. Find path from $s$ to $t$ that uses fewest number of edges.

## BFS (from source vertex s)

Put s onto a FIFO queue.
Repeat until the queue is empty:

- remove the least recently added vertex v
add each of v's unvisited neighbors to the queue and mark them as visited.

Property. BFS examines vertices in increasing distance from s.

Graph AP
maze explor tior
breadth-first search
challenges

## Breadth First Search

Depth-first search. Put unvisited vertices on a stack

```
private void bfs(Graph G, int s)
    Queue<Integer> q = new Queue<Integer>()
    q.enqueue(s);
    while (!q.isEmpty())
    { int v = q.dequeue();
        for (int w : G.adj(v))
        {
            if (dist[w] > G.V())
            l
            q. enqueue (w)
            dist[w] = dist[v] + 1;
        }
    }
}
}
```

## Connectivity Queries

Def. Vertices $v$ and $w$ are connected if there is a path between them. Def. A connected component is a maximal set of connected vertices.

Goal. Preprocess graph to answer queries: is v connected to w? in constant time

[^0]- Kevin Bacon numbers.
- Facebook.
- Fewest number of hops in a communication network.

Connected Components

Goal. Partition vertices into connected components.

Connected components
Initialize all vertices v as unmarked.
For each unmarked vertex $v$, run DFS and identify all vertices discovered as part of the same connected component.

| preprocess Time | query Time | extra Space |
| :---: | :---: | :---: |
| $E+V$ | 1 | $V$ |

Connected Components

Depth-first search for connected components

```
public class CCFinder
i
    private final static int UNMARKED = -1;
    private int components;
    private int[] cc
    public CCFinder (Graph G)
        for (int v = 0; v < G.v(); v++)
            (int v = 0; v < G.v(); v++)
                { dfs(G, v); components++;
    }
    private void dfs(Graph G, int v)
        cc[v] = components
            for (int w : G.adj(v))
            if (cc[w] == UNMARKED) dfs(G, w)
        }
    public int connected(int v, int w) « constant-time
    i return cc[v] == cc[w]; }
}
```

## Connected components application: Image processing

Goal. Read in a 2D color image and find regions of connected pixels that have the same color

Input: scanned image
Output: number of red and blue states

Connected components application: Image Processing

Goal. Read in a 2D color image and find regions of connected pixels that have the same color.

Efficient algorithm.

- Connect each pixel to neighboring pixel if same color.
- Find connected components in resulting graph.

Graph-processing challenge 5:

## Problem: Find a path from s to $\dagger$

Assumptions: any path will do

## randomized iterators

Which is faster, DFS or BFS?

1) DFS
2) BFS
3) about the same

4) depends on the graph
5) depends on the graph representation

## Graph-processing challenge 6

Problem: Find a path from $s$ to $t$ that uses every edge
Assumptions: need to use each edge exactly once

How difficult?

1) any CS126 student could do it
2) need to be a typical diligent CS226 student
3) hire an expert

4) intractable
5) no one knows

## Graph-processing challenge 7:

Problem: Find a path from $s$ to $t$ that visits every vertex
Assumptions: need to visit each vertex exactly once

How difficult?

1) any CS126 student could do it
2) need to be a typical diligent CS226 student
3) hire an expert

$0-1$
$0-6$
$0-2$
$4-3$
$5-3$
$5-4$
$0-5$
$6-4$
$1-2$
$2-6$
4) intractable
5) no one knows

Euler tour. Is there a cyclic path that uses each edge exactly once? Answer. Yes iff connected and all vertices have even degree. Tricky DFS-based algorithm to find path (see Algs in Java).

Graph-processing challenge 8:
Problem: Are two graphs identical except for vertex names?

How difficult?

1) any CS126 student could do it
2) need to be a typical diligent CS226 student
3) hire an expert
4) intractable
5) no one knows

Graph-processing challenge 9:
Problem: Can you lay out a graph in the plane without crossing edges?

How difficult?

1) any CS126 student could do it
2) need to be a typical diligent CS226 student
3) hire an expert
4) intractable
5) no one knows

[^0]:    Union-Find? not quite
