11. A Computing Machine

- Overview
- Data types
- Instructions
- Operating the machine
- Machine language programming

What is TOY?

An imaginary machine similar to:
- Ancient computers.
- Today's smartphone processors.
- Countless other devices designed and built over the past 50 years.

Reasons to study TOY

Prepare to learn about computer architecture
- How does your computer's processor work?
- What are its basic components?
- How do they interact?

Learn about machine-language programming.
- How do Java programs relate to computer?
- Key to understanding Java references.
- Still necessary in modern applications.

Learn fundamental abstractions that have informed processor design for decades.
### Bits and words

*Everything* in TOY is encoded with a sequence of *bits* (value 0 or 1).
- Why? Easy to represent two states (on and off) in real world.
- Bits are organized in 16-bit sequences called *words*.

More convenient for humans: *hexadecimal notation* (base 16)
- 4 *hex digits* in each word.
- Convert to and from binary 4 bits at a time.

<table>
<thead>
<tr>
<th>Binary</th>
<th>Hex</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>0</td>
</tr>
<tr>
<td>0001</td>
<td>1</td>

</tbody>
</table>

### Inside the box

Components of TOY machine
- Memory
- Registers
- Arithmetic and logic unit (ALU)
- PC and IR

### Memory

Holds data and instructions
- 256 words
- 16 bits in each word.
- Connected to registers.
- Words are *addressable*.

Use *hexadecimal* for addresses
- Number words from 00 to FF.
- *Think in hexadecimal.*

<table>
<thead>
<tr>
<th>Memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>00 000</td>
</tr>
<tr>
<td>01 002</td>
</tr>
<tr>
<td>02 004</td>
</tr>
<tr>
<td>03 006</td>
</tr>
<tr>
<td>04 008</td>
</tr>
<tr>
<td>05 00A</td>
</tr>
<tr>
<td>06 00C</td>
</tr>
<tr>
<td>07 00E</td>
</tr>
</tbody>
</table>

Table of 256 words *completely specifies* contents of memory.

### Arithmetic and logic unit (ALU)

ALU
- TOY’s computational engine.
- A *calculator*, not a computer.
- Hardware that implements all data-type operations.
- How? Stay tuned for computer architecture lectures.
Registers

- 16 words, addressable in hex from 0 to F (use names R0 through RF)
- Scratch space for calculations and data movement.
- Connected to memory and ALU
  - By convention, R0 is always 0.

Table of 16 words completely specifies contents of registers.

Q. Why not just connect memory directly to ALU?
A. Too many different memory names (addresses).

Q. Why not just connect memory locations to one another?
A. Too many different connections.

Program counter and instruction register

TOY operates by executing a sequence of instructions.

Critical abstractions in making this happen
- Program Counter (PC). Memory address of next instruction.
- Instruction Register (IR). Instruction being executed.

Fetch-increment-execute cycle
- Fetch: Get instruction from memory into IR.
- Increment: Update PC to point to next instruction.
- Execute: Move data to or from memory, change PC, or perform calculations, as specified by IR.

The state of the machine

Contents of memory, registers, and PC at a particular time
- Provide a record of what a program has done.
- Completely determines what the machine will do.

ALU and IR hold intermediate states of computation.

11. A Computing Machine

- Overview
  - Data types
  - Instructions
  - Operating the machine
  - Machine language programming
11. A Computing Machine

- **Overview**
- **Data types**
- **Instructions**
- **Operating the machine**
- **Machine language programming**

### TOY data type

A **data type** is a set of values and a set of operations on those values.

**TOY's data type** is 16-bit 2s complement integers.

#### Two kinds of operations

- Arithmetic.
- Bitwise.

All other types of data must be implemented with software:

- 32-bit and 64-bit integers.
- 32-bit and 64-bit floating point values.
- Characters and strings.

* ...

**All values are represented in 16-bit words.**

### TOY data type (original design): Unsigned integers

**Values.** 0 to $2^{16} - 1$, encoded in binary (or, equivalently, hex).

<table>
<thead>
<tr>
<th>decimal</th>
<th>hex</th>
<th>binary</th>
</tr>
</thead>
<tbody>
<tr>
<td>+1</td>
<td>0001</td>
<td>0000000000000001</td>
</tr>
<tr>
<td>+2</td>
<td>0002</td>
<td>0000000000000010</td>
</tr>
<tr>
<td>+3</td>
<td>0003</td>
<td>0000000000000011</td>
</tr>
</tbody>
</table>

**Operations.**

- Add.
- Subtract.
- Test if 0.

**Example.** $6375_{10}$.

**Warning.** TOY ignores overflow.

### TOY data type (better design): 2s complement

**Values.** $-2^{15}$ to $2^{15} - 1$, encoded in 16-bit 2s complement.

**Operations.**

- Add.
- Subtract.
- Test if positive, negative, or 0.

**16 bit 2s complement**

- 16-bit binary representation of $x$ for positive $x$.
- 16-bit binary representation of $2^{16} - |x|$ for negative $x$.

**Useful properties**

- Leading bit (bit 15) signifies sign.
- $0000000000000000$ represents zero.
- Add/subtract is *the same* as for unsigned.

**Table:**

<table>
<thead>
<tr>
<th>decimal</th>
<th>hex</th>
<th>binary</th>
</tr>
</thead>
<tbody>
<tr>
<td>+32,767</td>
<td>7FFF</td>
<td>0111111111111111</td>
</tr>
<tr>
<td>+32,766</td>
<td>7FFE</td>
<td>0111111111111110</td>
</tr>
<tr>
<td>+32,765</td>
<td>7FFD</td>
<td>0111111111111101</td>
</tr>
</tbody>
</table>

**Example.** $18E7 + 18E7 = 31CE$

**Warning.** Slight annoyance: one extra negative value.
2s complement: conversion

To convert from decimal to 2s complement
- If greater than 32,767 or less than -32,768 report error.
- Convert to 16-bit binary.
- If not negative, done.
- If negative, flip all bits and add 1.

Examples

<table>
<thead>
<tr>
<th>x</th>
<th>x AND y</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>x</th>
<th>x XOR y</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

To convert from 2s complement to decimal
- If sign bit is 1, flip all bits and add 1 and output minus sign.
- Convert to decimal.

Examples

<table>
<thead>
<tr>
<th>x</th>
<th>x AND y</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

To add/subtract
- Use same rules as for unsigned binary.
- (Still) ignore overflow.

Overflow in 2s complement

- \[ 32,767_{10} = 2^{15} - 1 \]
- \[ 0111111111111111_{2} \]
- \[ 7FF_{16} \]
- \[ +1 \]
- \[ 0000000000000000_{2} \]
- \[ 0001 \]
- \[ largest positive number \]
- \[ = 1000000000000000_{2} \]
- \[ = 8000 \]
- \[ smallest negative number \]
- \[ = -2^{15} = -32,768_{10} \]

Examples

<table>
<thead>
<tr>
<th>x</th>
<th>x AND y</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

Special note: Shift left/right operations also implement multiply/divide by powers of 2 for integers.

11. A Computing Machine

- Machine language programming

TOY data type: Bitwise operations

Operations
- Bitwise AND.
- Bitwise XOR.
- Shift left.
- Shift right.

<table>
<thead>
<tr>
<th>x</th>
<th>x AND y</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>x</th>
<th>x XOR y</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

Shift left 3

Shift right 3

Special note: Shift left/right operations also implement multiply/divide by powers of 2 for integers.

shift right fills with 1s if leading bit is 1

- Instructions
- Operating the machine
- Machine language programming

### TOY instructions

ANY 16-bit (4 hex digit) value defines a TOY instruction.

**First hex digit** specifies which instruction.

Each instruction changes machine state in well-defined ways.

<table>
<thead>
<tr>
<th>category</th>
<th>opcodes</th>
<th>implements</th>
<th>changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>operations</td>
<td>1 2 3 4 5 6</td>

<td>data moves between registers and memory</td>
<td>registers, memory</td>
</tr>
<tr>
<td>flow of control</td>
<td>0 C D E F</td>
<td>conditionals, loops, and functions</td>
<td>PC</td>
</tr>
</tbody>
</table>

### Encoding instructions

ANY 16-bit (4 hex digit) value defines a TOY instruction.

**Two different instruction formats**

- **Type 1**: Opcode and 3 registers.
- **Type 2**: Opcode, 1 register, and 1 memory address.

### A TOY program

**Add two integers**

- Load operands from memory into registers.
- Add the registers.
- Put result in memory.

- Load RA data from men[01]
- Load RB data from men[02]
- Add RA and RB and put result into RC
- Store RC into men[03]
- Halt

**Q. How can you tell whether a word is an instruction?**

**A.** If the PC has its address, it *is* an instruction!
Same program with different data

Add two integers
• Load operands from memory into registers.
• Add the registers.
• Put result in memory.

<table>
<thead>
<tr>
<th>PC</th>
<th>Registers</th>
<th>Memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>RA ← mem[01]</td>
<td>8 0 0 1</td>
</tr>
<tr>
<td>11</td>
<td>RB ← mem[02]</td>
<td>8 8 0 2</td>
</tr>
<tr>
<td>12</td>
<td>RC ← RA + RB</td>
<td>1 C A B</td>
</tr>
<tr>
<td>13</td>
<td>mem[03] ← RC</td>
<td>9 C 0 3</td>
</tr>
<tr>
<td>14</td>
<td>halt</td>
<td>0 0 0 0</td>
</tr>
</tbody>
</table>

11. A Computing Machine

• Overview
• Data types
• Instructions
• Operating the machine
• Machine language programming

Outside the box

User interface
• Switches.
• Lights.
• Control Buttons.

First step: Turn on the machine!
Loading data into memory

To load data
- Set 8 memory address switches.
- Set 16 data switches to data encoding.
- Press LOAD to load data from switches into addressed memory word.

Loading instructions into memory

Use the same procedure as for data
- Set 8 memory address switches.
- Set 16 data switches to instruction encoding.
- Press LOAD to load instruction from switches into addressed memory word.

Looking at what's in the memory

To double check that you loaded the data correctly
- Set 8 memory address switches.
- Press LOOK to examine the addressed memory word.

Looking at what's in the memory

To double check that you loaded the data correctly
- Set 8 memory address switches.
- Press LOOK to examine the addressed memory word.
Loading instructions into memory

Use the same procedure as for data
• Set 8 memory address switches.
• Set 16 data switches to instruction encoding.
• Press LOAD to load instruction from switches into addressed memory word.

Running a program

To run a program, set the address switches to the address of first instruction and press RUN.
[ data lights may flash, but all go off when HALT instruction is reached ]

To see the output, set the address switches to the address of expected result and press LOOK.
### 11. A Computing Machine

- Overview
- Data types
- Instructions
- Operating the machine
- Machine language programming

**Machine language programming**

TOY instructions support the same basic programming constructs that you learned in Java. These include:
- Primitive data types.
- Assignment statements.
- Conditionals and loops.
- Standard input and output (this section).
- Arrays (this section).

*and can support advanced constructs, as well.*
- Functions and libraries.
- Objects.
Conditionals and loops

To control the flow of instruction execution
- Test a register’s value.
- Change the PC, depending on the value.

Example: Absolute value of RA
10 DA12 if RA > 0 set PC to 12 (skip 11)
11 2A0A Subtract RA from 0 (R0) and put result into RA
12 ...

Example: Typical while loop (assumes R1 is 0001)
10 CA15 if RA = 0 set PC to 15
11 ...
12 ...
13 2AA1 Decrement RA by 1
14 C010 Set PC to 10
15 ...

Op code instruction

C branch if zero
D branch if positive

Standard input and output

An immediate problem
- We can’t be using switches and lights all the time!
- One solution: Paper tape.

Punched paper tape
- Encode 16-bit words in two 8-bit rows.
- To write a word, punch a hole for each 1.
- To read a word, shine a light behind the tape and sense the holes.

TOY mechanism
- Connect hardware to memory location FF.
- To write the contents of a register to stdout, store to FF.
- To read from stdin into a register, load from FF.

Flow control and standard output example: Fibonacci numbers

Memory

Register trace

PC

TOY mechanism

Need to bolt new I/O devices to the side of the machine.
Arrays

To implement an array
- Keep items in an array contiguous starting at mem address a.
- Access a[i] at mem[a+i].

To access an array element, use indirection
- Keep array address in a register.
- Add index
- Indirect load/store uses contents of a register.

Example: Indirect store

</tbody>
</table>

Stay tuned.
Full trace in next lecture.

TOY vs. your laptop

Two different computing machines
- Both implement basic data types, conditionals, loops, and other low-level constructs.
- Both can have arrays, functions, and other high-level constructs.
- Both have infinite input and output streams.

Q. Is 256 words enough to do anything useful?
A. Yes! (Stay tuned for next lecture.)

OK, we definitely want a faster version with more memory when we can afford it...

TEQ 1 on TOY

Q. What is the interpretation of

1A75 as a TOY instruction?
1A75 as a 2s complement integer value?

0FF as a TOY instruction?
0FF as a 2s complement integer value?

8888 as a TOY instruction?
8888 as a 2s complement integer value? (Answer in base 16).

TEQ 2 on TOY

Q. How does one flip all the bits in a TOY register?

TEQ 3 on TOY

Q. What does the following TOY program leave in R2?

80

107 C 0 A    RC ← 1010
117 1 0 1    R1 ← 1
127 2 0 1    R2 ← 1
131 2 2 2    R2 ← R2 + R2
142 C C 1    RC ← RC - 1
15D C 1 3    IF (RC > 0) PC ← 13
160 0 0 0    HALT
