# Assembly Language: Overview

## Goals of this Lecture

- Help you learn:
  - The basics of computer architecture
  - The relationship between C and assembly language
  - IA-32 assembly language, through an example

## Three Levels of Languages

## High-Level Language

- Examples: C, C++, Java, Pascal, …
- Make programming easier by describing operations in a semi-natural language
- Increase the portability of the code
- One line of code may involve many low-level operations

```
count = 0;
while (n > 1) {
  count++;
  if (n & 1)
    n = n*3 + 1;
  else
    n = n/2;
}
```

## Assembly Language

- E.g., IA-32 from Intel
- Tied to specifics of the underlying machine
- Commands and names represent bit patterns, to make code readable, writeable by humans
- Hand-coded assembly may be more efficient than what compiler generates

```
        movl   $0, %ecx
loop:
        cmpl   $1, %edx
        jle    endloop
        addl   $1, %ecx
        movl   %edx, %eax
        andl   $1, %eax
        je     else
        movl   %edx, %eax
        addl   %eax, %edx
        addl   %eax, %edx
        addl   $1, %edx
        jmp    endif
else:
        sarl   $1, %edx
endif:
        jmp    loop
endloop:
```

## Machine Language

- Also tied to the underlying machine
- What hardware sees and deals with
- Every instruction is a sequence of one or more numbers
- All stored in memory on the computer, and read and executed
- Unreadable by humans

```
0000 0000 0000 0000 0000 0000 0000 0000

```

## Why Learn Assembly Language?

- Write faster code (even in high-level language)
  - By understanding which high-level constructs are more efficient at the machine level
- Understand how things work underneath
  - Learn the basic organization of the underlying machine
  - Learn how the computer actually runs a program
  - Design better computers in the future
- Some software is written in assembly language
  - Code that really needs to run quickly
  - Code for embedded systems, network processors, etc.

7

## Why Learn Intel IA-32 Assembly?

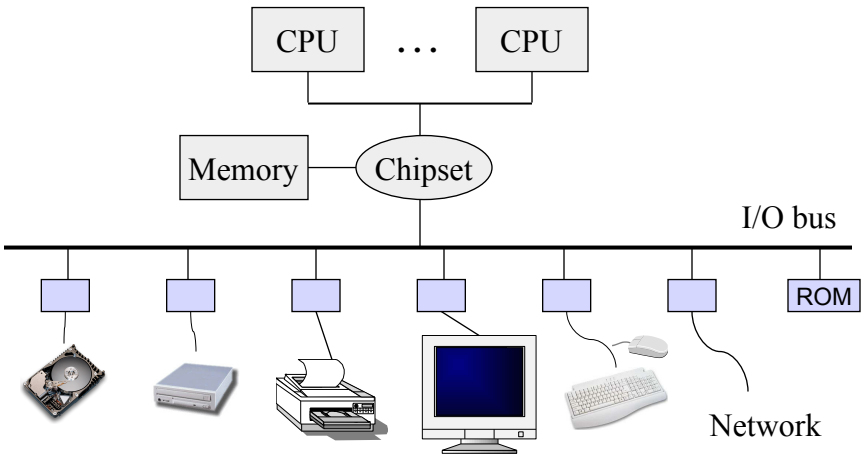
- Program natively on our computing platform
  - Rather than using an emulator to mimic another machine
- Learn instruction set for the most popular platform
  - Most likely to work with Intel platforms in the future
- But, this comes at some cost in complexity
  - IA-32 has a large and varied set of instructions
  - More instructions than are really useful in practice
- Fortunately, you won't need to use everything

8

# Computer Architecture

9

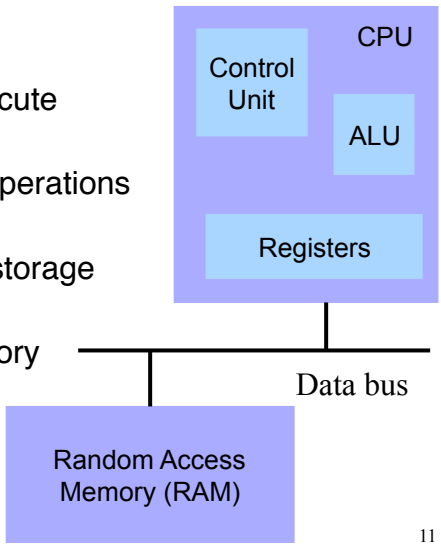
## A Typical Computer



10

# Von Neumann Architecture

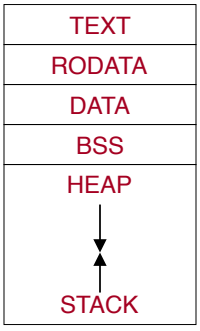
- Central Processing Unit
  - Control unit
    - Fetch, decode, and execute
  - Arithmetic and logic unit
    - Execution of low-level operations
  - General-purpose registers
    - High-speed temporary storage
  - Data bus
    - Provide access to memory

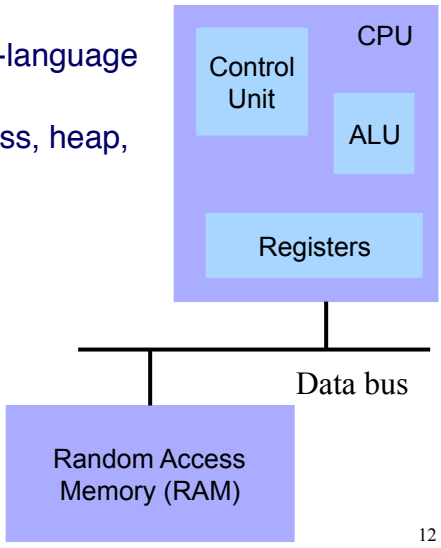


11

# Von Neumann Architecture

- Memory
  - Store executable machine-language instructions (text section)
  - Store data (rodata, data, bss, heap, and stack sections)

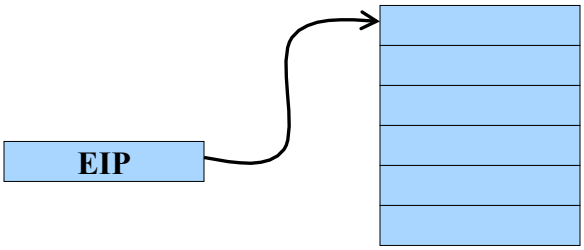




12

## Control Unit: Instruction Pointer

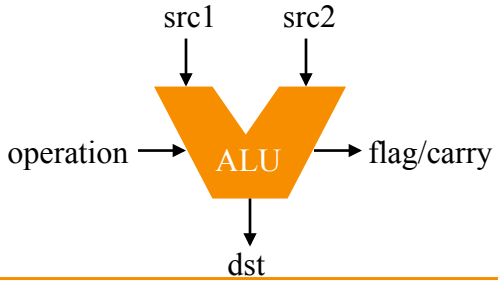
- EIP: Stores the location of the next instruction
  - Address to use when reading machine-language instructions from memory (i.e., in the text section)
- Changing the instruction pointer
  - Increment it to go to the next instruction
  - Or, load a new value into EIP to "jump" to a new location



13

## Control Unit: Instruction Decoder

- Determines what operations need to take place
  - Translates the machine-language instruction
- Control what operations are done on what data
  - E.g., control what data are fed to the ALU
  - E.g., enable the ALU to do multiplication or addition
  - E.g., read from a particular address in memory



14

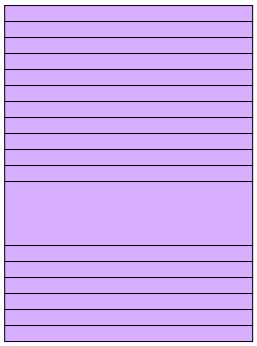
## Registers

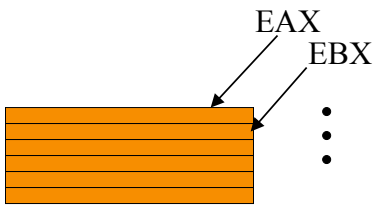
- Small amount of storage on the CPU
  - Can be accessed more quickly than main memory
  - Each register has a name, which assembly code uses
- Instructions move data in and out of registers
  - Loading (into) registers from main memory
  - Storing (from) registers to main memory
- Instructions manipulate the register contents
  - Registers essentially act as temporary variables
  - For efficient manipulation of the data
- Registers are the top of the memory hierarchy
  - Ahead of caches, main memory, disk, tape, …

15

## Keeping it Simple: All 32-bit Words

- Simplifying assumption: all data in four-byte units
  - Memory is 32 bits wide
  - Registers are 32 bits wide





- In practice, can manipulate different sizes of data

16

# C Code vs. Assembly Code

17

## Kinds of Instructions

```
count = 0;
while (n > 1) {
  count++;
  if (n & 1)
    n = n*3 + 1;
  else
    n = n/2;
}
```

- Reading and writing data
  - count = 0
  - n
- Arithmetic and logic operations
  - Increment: count++
  - Multiply: n * 3
  - Divide: n/2
  - Bitwise AND: n & 1
- Checking results of comparisons
  - Is (n > 1) true or false?
  - Is (n & 1) non-zero or zero?
- Changing the flow of control
  - To the end of the while loop (if "n > 1")
  - Back to the beginning of the loop
  - To the else clause (if "n & 1" is 0)

18

## Assign Registers to key Variables

```
count = 0;
while (n > 1) {
  count++;
  if (n & 1)
    n = n*3 + 1;
  else
    n = n/2;
}
```

**Registers**

```
n       %edx
count   %ecx
```

**Referring to a register: percent sign (“%”)**

19

## Addressing Registers and Immediates

```
count=0;                    movl  $0, %ecx
while (n>1) {
  count++;                  addl  $1, %ecx
  if (n&1)
    n = n*3+1;
  else
    n = n/2;
}
```

Read directly from the instruction

written to a register

**Referring to a immediate operand: dollar sign (“$”)**

20

## Addressing Registers and Immediates

```
count=0;
while (n>1) {
  count++;
  if (n&1)
    n = n*3+1;
  else
    n = n/2;
}
```

```
movl  %edx, %eax
andl  $1, %eax
```

Computing intermediate value in register EAX

21

## Addressing Registers and Immediates

```
count=0;
while (n>1) {
  count++;
  if (n&1)
    n = n*3+1;
  else
    n = n/2;
}
```

```
movl  %edx, %eax
addl  %eax, %edx
addl  %eax, %edx
addl  $1, %edx
```

Update %edx this time, since changing value of n

22

## Addressing Registers and Immediates

```
count=0;
while (n>1) {
  count++;
  if (n&1)
    n = n*3+1;
  else
    n = n/2;
}
```

```
sarl  $1, %edx
```

## Changing Program Flow

```
count=0;
while (n>1) {
  count++;
  if (n&1)
    n = n*3+1;
  else
    n = n/2;
}
```

- Cannot simply run next instruction
  - Check result of a previous operation
  - Jump to appropriate next instruction
- Flags register (EFLAGS)
  - Stores the status of operations, such as comparisons, as a side effect
  - E.g., last result was positive, negative, zero, etc.
- Jump instructions
  - Load new address in instruction pointer
- Example jump instructions
  - Jump unconditionally (e.g., "}")
  - Jump if zero (e.g., "while (n&1)")
  - Jump if greater/less (e.g., "if (n>1)")

## Conditional and Unconditional Jumps

- Comparison **`cmpl`** compares two integers
  - Done by subtracting the first number from the second
    - Discarding the results, but setting flags as a side effect
  - Example:
    - **`cmpl $1, %edx`** (computes %edx – 1)
    - **`jle endloop`** (checks whether result was 0 or negative)
- Logical operation **`andl`** compares two integers
  - Example:
    - **`andl $1, %eax`** (bit-wise AND of %eax with 1)
    - **`je else`** (checks whether result was 0)
- Also, can do an unconditional branch **`jmp`**
  - Example:
    - **`jmp endif`** and **`jmp loop`**

25

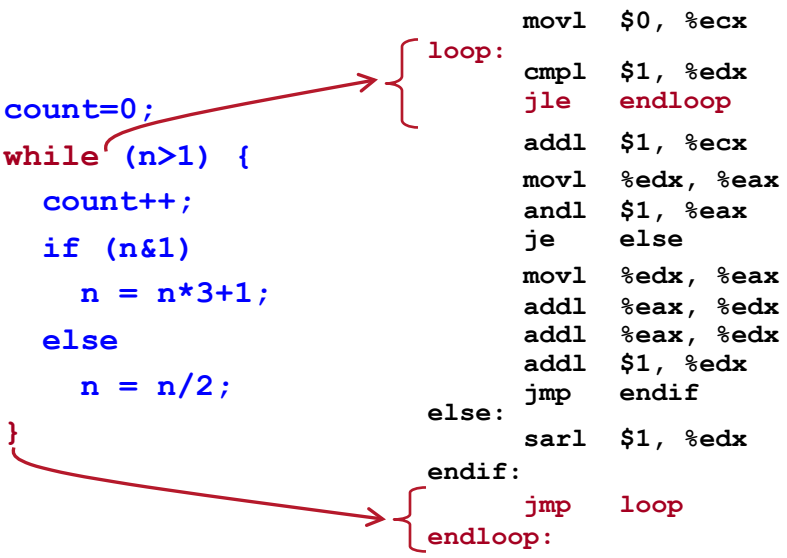
## Jump and Labels: While Loop

```
loop:   cmpl   $1, %edx
        jle    endloop
        ...
while (n>1) {
}
        jmp    loop
endloop:
```

Checking if EDX is less than or equal to 1.

26

## Jump and Labels: While Loop



```
count=0;
while (n>1) {
  count++;
  if (n&1)
    n = n*3+1;
  else
    n = n/2;
}
```

```
        movl   $0, %ecx
loop:
        cmpl   $1, %edx
        jle    endloop
        addl   $1, %ecx
        movl   %edx, %eax
        andl   $1, %eax
        je     else
        movl   %edx, %eax
        addl   %eax, %edx
        addl   %eax, %edx
        addl   $1, %edx
        jmp    endif
else:
        sarl   $1, %edx
endif:
        jmp    loop
endloop:
```

27

## Jump and Labels: If-Then-Else

```
if (n&1)
  ...
else
  ...
```

```
        movl   %edx, %eax
        andl   $1, %eax
        je     else
        ...
        jmp    endif
else:
        ...
endif:
```

"then" block

"else" block

28

## Jump and Labels: If-Then-Else

```
count=0;
while(n>1) {
  count++;
  if (n&1)
    n = n*3+1;
  else
    n = n/2;
}
```

```
        movl   $0, %ecx
loop:
        cmpl   $1, %edx
        jle    endloop
        addl   $1, %ecx
        movl   %edx, %eax
        andl   $1, %eax
        je     else
        movl   %edx, %eax
        addl   %eax, %edx
        addl   %eax, %edx
        addl   $1, %edx
        jmp    endif
else:
        sarl   $1, %edx
endif:
        jmp    loop
endloop:
```

"then" block

"else" block

29

## Making the Code More Efficient…

```
count=0;
while(n>1) {
  count++;
  if (n&1)
    n = n*3+1;
  else
    n = n/2;
}
```

```
        movl   $0, %ecx
loop:
        cmpl   $1, %edx
        jle    endloop
        addl   $1, %ecx
        movl   %edx, %eax
        andl   $1, %eax
        je     else
        movl   %edx, %eax
        addl   %eax, %edx
        addl   %eax, %edx
        addl   $1, %edx
        jmp    endif
else:
        sarl   $1, %edx
endif:
        jmp    loop
endloop:
```

Replace with "jmp loop"

30

## Complete Example

```
n      %edx
count  %ecx
```

```
count=0;
while (n>1) {
  count++;
  if (n&1)
    n = n*3+1;
  else
    n = n/2;
}
```

```
        movl   $0, %ecx
loop:
        cmpl   $1, %edx
        jle    endloop
        addl   $1, %ecx
        movl   %edx, %eax
        andl   $1, %eax
        je     else
        movl   %edx, %eax
        addl   %eax, %edx
        addl   %eax, %edx
        addl   $1, %edx
        jmp    endif
else:
        sarl   $1, %edx
endif:
        jmp    loop
endloop:
```

31

## Reading IA-32 Assembly Language

- Referring to a register: percent sign ("%")
  - E.g., "%ecx" or "%eip"
- Referring to immediate operand: dollar sign ("$")
  - E.g., "$1" for the number 1
- Storing result: typically in the second argument
  - E.g. "addl $1, %ecx" increments register ECX
  - E.g., "movl %edx, %eax" moves EDX to EAX
- Assembler directives: starting with a period (".")
  - E.g., ".section .text" to start the text section of memory
- Comment: pound sign ("#")
  - E.g., "# Purpose: Convert lower to upper case"

32

## Conclusions

- Assembly language
  - In between high-level language and machine code
  - Programming the "bare metal" of the hardware, but mnemonically and not just with bits (machine language)
  - Loading and storing data, arithmetic and logic operations, checking results, and changing control flow
- To get more familiar with IA-32 assembly
  - Read more assembly-language examples
    - Chapter 3 of Bryant and O'Hallaron book
  - Generate your own assembly-language code
    - gcc217 –S –O2 code.c

33
