

COMPUTER SCIENCE SEDGEWICK/WAYNE

Universality and computability

Fundamental questions

- What is a general-purpose computer?
- Are there limits on the power of digital computers?
- Are there limits on the power of machines we can build?

Pioneering work at Princeton in the 1930s.

Asked the questions

3

problem

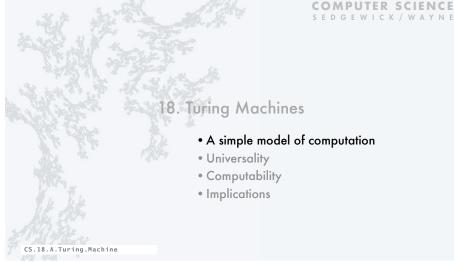

Solved the decision problem Provided THE answers

Context: Mathematics and logic Principia Mathematics Mathematics. Any formal system powerful enough to express arithmetic. Peano arithmetic Zermelo-Fraenkel set theory Complete. Can prove truth or falsity of any arithmetic statement. Consistent. Cannot prove contradictions like 2 + 2 = 5. Decidable. An algorithm exists to determine truth of every statement.

Q. (Hilbert, 1900) Is mathematics complete and consistent? A. (Gödel's Incompleteness Theorem, 1931) NO (!!!)

Q. (Hilbert's Entscheidungsproblem) Is mathematics decidable? A. (Church 1936, Turing 1936) NO (!!)

Starting point

Goals

- Develop a model of computation that encompasses all known computational processes.
- Make the model as simple as possible.

Example: A familiar computational process.

1	0	1	0		
	3	1	4	2	
	7	1	8	2	
1	0	3	2	4	

Characteristics

Discrete.
Local.
States.

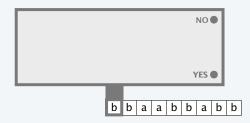

Previous lecture: DFAs

A DFA is an abstract machine that solves a pattern matching problem.

- A string is specified on an input tape (no limit on its length).
- The DFA reads each character on input tape once, moving left to right.

• The DFA lights "YES" if it *recognizes* the string, "NO" otherwise. Each DFA defines a *set* of strings (all the strings that it recognizes).

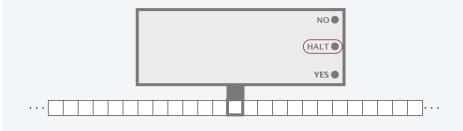

This lecture: Turing machines

A Turing machine (TM) is an abstract model of computation.

- A string is specified on a tape (no limit on its length).
- The TM reads and writes characters on the tape, moving left or right.)
- The TM lights "YES" if it recognizes the string, "NO" otherwise.

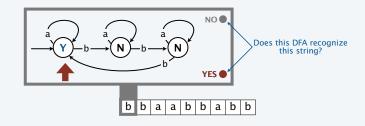

Previous lecture: DFA details and example

A DFA is an abstract machine with a finite number of *states*, each labelled Y or N and *transitions* between states, each labelled with a symbol. One state is the *start* state.

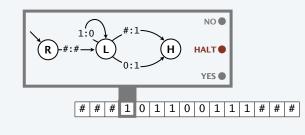

- Begin in the start state.
- Read an input symbol and move to the indicated state.
- Repeat until the last input symbol has been read.
- Turn on the "YES" or "NO" light according to the label on the current state.

This lecture: Turing Machine details and example

A Turing Machine is an abstract machine with a finite number of *states*, each labelled Y, N,

- H, L, or R and *transitions* between states, each labelled with a read/write pair of symbols.
- Begin in the designated *start* state.
- Read an input symbol, move to the indicated state and write the indicated output.
- Move tape head left if new state is labelled L, right if it is labelled R.
- Repeat until entering a state labelled Y, N, or H (and turn on associated light).

DFAs vs TMs

Similarities

- Simple model of computation.
- Input on tape is a finite string with symbols from a finite alphabet.
- Finite number of states.
- State transitions determined by current state and input symbol.

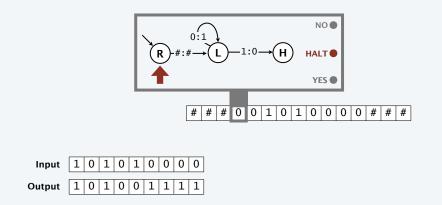

Differences

TMs

DFAs

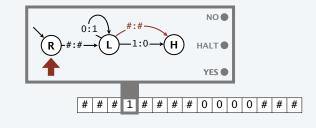

- Can read input symbols from the tape.
- Can only move tape head to the right.
- Tape is finite (a string).
- One state transition per input symbol.
- Can recognize (turn on "YES" or "NO").
- Can read from or write onto the tape.
- Can move tape head either direction.
- Tape does not end (either direction).
- No limit on number of transitions.
- Can also *compute* (with output on tape).

TM example 1: Binary decrementer

TM example 1: Binary decrementer

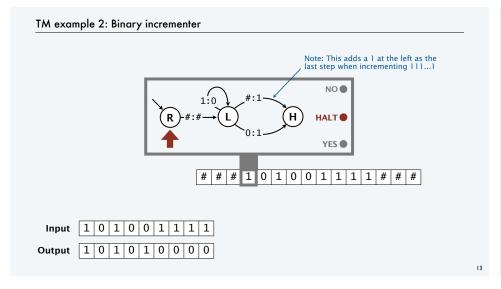

Q. What happens when we try to decrement 0?

A. Doesn't halt! TMs can have bugs, too.

Fix to avoid infinite loop. Check for #.

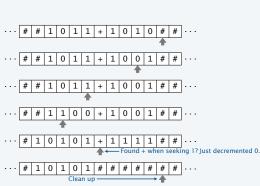

Ш

TM example 3: Binary adder (method)

To compute x + y

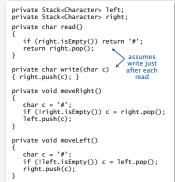

- Move right to right end of y.
 Decrement y.
 Move left to right end of x (left of +).
 # # 1 0 1 1 + 1
 # # 1 0 1 1 + 1
- Increment x.
- Continue until y = 0 is decremented.
- Clean up by erasing + and 1s.

TM example 3: Binary adder # 1 0 1 1 + 1 0 1 0 # NO 🔴 0:1 Find + Decrement y # 1 0 1 1 + 1 0 0 1 # HALT Halt # 1 0 1 1 + 1 0 0 1 # YES ● H R # 1 1 0 0 + 1 0 0 1 # Clean Up #:# 4 0:1 Find right end **R** Increment x L :0 1 0 1 0 1 + 1 1 1 # -1 0 1 0 1 # # # # # # # # # 1 0 1 1 + 1 0 1 0 # #

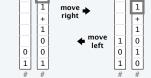

Simulating an infinite tape with two stacks

- $\ensuremath{\mathsf{Q}}\xspace.$ How can we simulate a tape that is infinite on both ends?
- A. Use two stacks, one for each end.

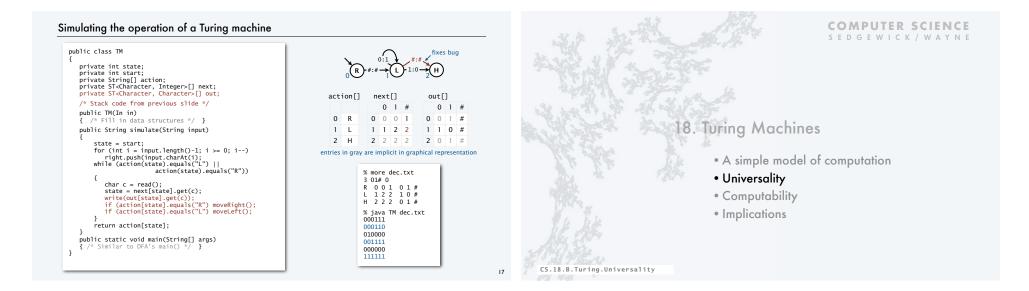

15

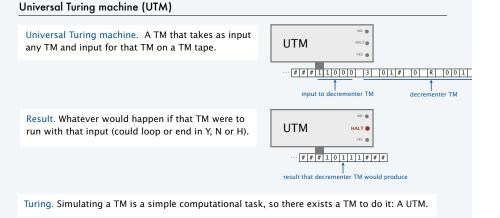

Turing's key insight. A TM is nothing more than a finite sequence of symbols.

Implication. Can put a TM and its input on a TM tape.

Profound implication. We can use a TM to simulate the operation of any TM.

Easier for us to think about. Implement Java simulator as a TM.

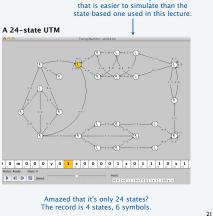

Implementing a universal Turing machine

Java simulator gives a roadmap

- No need for constructor because everything is already on the tape.
- Simulating the infinite tape is a bit easier because TM has an infinite tape.
- Critical part of the calculation is to update state as indicated.

Want to see the details or build your own TM? Use the booksite's TM development environment.

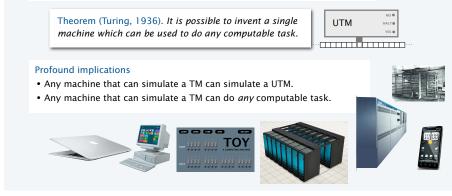

Note: This booksite UTM uses a

transition-based TM representation

Universality

UTM: A simple and universal model of computation.

Definition. A task is computable if a Turing machine exists that computes it.

A profound connection to the real world

• A thesis, not a theorem.

• Not subject to proof.

Church-Turing thesis. Turing machines can do anything that can be described by *any* physically harnessable process of this universe: *All computational devices are equivalent*.

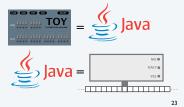

Remarks

New model of computation or new physical process?

- Use *simulation* to prove equivalence.
- Example: TOY simulator in Java.
- Is subject to falsification. Example: Java compiler in TOY.

Implications

- No need to seek more powerful machines or languages.
- Enables rigorous study of computation (in this universe).

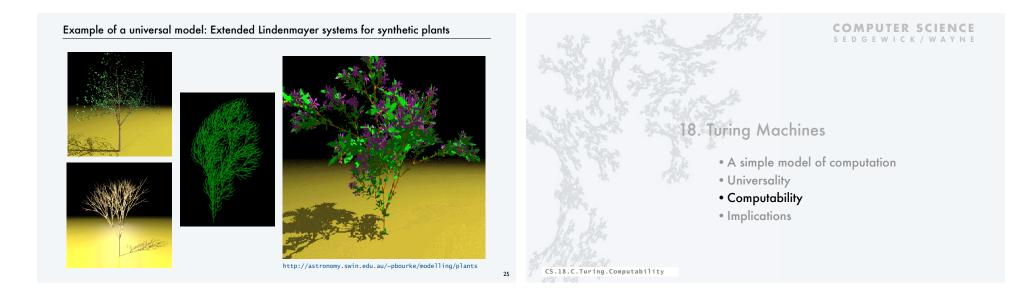

Evidence in favor of the Church-Turing thesis

Evidence. Many, many models of computation have turned out to be equivalent (universal).

model of computation	description
enhanced Turing machines	multiple heads, multiple tapes, 2D tape, nondeterminism
untyped lambda calculus	method to define and manipulate functions
recursive functions	functions dealing with computation on integers
unrestricted grammars	iterative string replacement rules used by linguists
extended Lindenmayer systems	parallel string replacement rules that model plant growth
programming languages	Java, C, C++, Perl, Python, PHP, Lisp, PostScript, Excel
random access machines	registers plus main memory, e.g., TOY, Pentium
cellular automata	cells which change state based on local interactions
quantum computer	compute using superposition of quantum states
DNA computer	compute using biological operations on DNA
PCP systems	string matching puzzles (stay tuned)

8 decades without a counterexample, and counting.

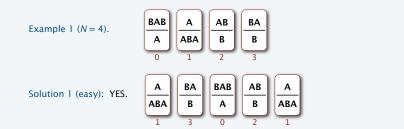

Post's correspondence problem (PCP)

PCP. A family of puzzles, each based on a set of cards.

• N types of cards.

- No limit on the number of cards of each type.
- Each card has a top string and bottom string.

Does there exist an arrangement of cards with matching top and bottom strings?

Post's correspondence problem (PCP)

PCP. A family of puzzles, each based on a set of cards.

- N types of cards.
- No limit on the number of cards of each type.
- Each card has a top string and bottom string.

Does there exist an arrangement of cards with matching top and bottom strings?

Example 2 (N = 4).

BAB	A	AB	BA
Α	BAB	В	A
0	1	2	3

Solution 2 (easy): NO. No way to match even the first character!

Post's correspondence problem (PCP)

PCP. A family of puzzles, each based on a set of cards.

- N types of cards.
- No limit on the number of cards of each type.
- Each card has a top string and bottom string.

Does there exist an arrangement of cards with matching top and bottom strings?

Example 3 (created by Andrew Appel).

Challenge for the bored: Find a solution that starts with a card of type 0.

Post's correspondence problem (PCP)

PCP. A family of puzzles, each based on a set of cards.

- N types of cards.
- No limit on the number of cards of each type.
- Each card has a top string and bottom string.

Does there exist an arrangement of cards with matching top and bottom strings?

A reasonable idea. Write a program to take N card types as input and solve PCP.

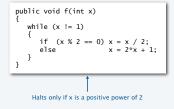

A surprising fact. It is not possible to write such a program.

Another impossible problem

Halting problem. Write a Java program that reads in code for Java static method f()and an input x, and decides whether or not f(x) results in an infinite loop.

3

Example 1 (easy).

Example 2 (difficulty unknown).

f(7): 7 22 11 34 17 52 26 13 40 20 10 5 16 8 4 2 1 f(-17): -17 -50 -25 -74 -37 -110 -55 -164 -82 -41 -122 ... -17 ...

Next. A proof that it is not possible to write such a program.

Undecidability of the halting problem

Definition. A yes-no problem is undecidable if no Turing machine exists to solve it. (A problem is computable if there does exist a Turing machine that solves it.)

Theorem (Turing, 1936). The halting problem is undecidable.

Profound implications

- There exists a problem that no Turing machine can solve.
- There exists a problem that no computer can solve.
- There exist many problems that no computer can solve (stay tuned).

29

Warmup: self-referential statements

Liar paradox (dates back to ancient Greek philosophers).

- Divide all statements into two categories: true and false.
- Consider the statement "This statement is false."
- Is it true? If so, then it is false, a contradiction.
- Is it false? If so, then it is true, a contradiction.

Logical conclusion. Cannot label *all* statements as true or false.

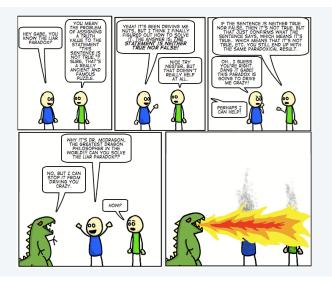

Source of the difficulty: Self-reference.

calamitiesofnature.com @ 2009 Tony Pir

Proof of the undecidability of the halting problem

Theorem (Turing, 1936). The halting problem is undecidable.

Proof outline.

• Assume the existence of a function halt(f, x) that solves the problem.

By universality, may as well use Java. (If this exists, we could simulate it on a TM.)

- Arguments: A function f and input x, encoded as strings.
- Return value: true if f(x) halts and false if f(x) does not halt.
- Always halts.
- Proof idea: Reductio ad absurdum: if any logical argument based on an assumption leads to an absurd statement, then the assumption is false.

33

Proof of the undecidability of the halting problem

Theorem (Turing, 1936). The halting problem is undecidable.

Proof.

- Assume the existence of a function halt(f, x) that solves the problem.
- Create a function strange(f) that goes into an infinite loop if f(f) halts and halts otherwise.
- Call strange() with *itself* as argument.
- If strange(strange) halts, then strange(strange) goes into an infinite loop.
- If strange(strange) does not halt, then strange(strange) halts.
- Reductio ad absurdum.
- halt(f,x) cannot exist.

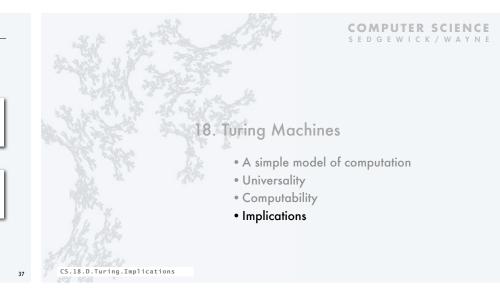

Solution to the problem							
public	boolean	halt(String	f,	String >	0		

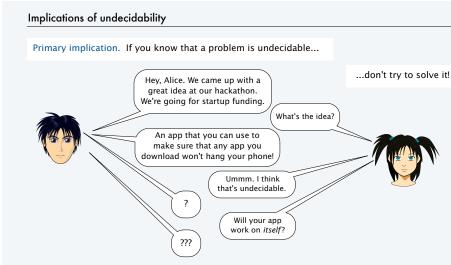

A client

public void strange(String f)
{
 if (halt(f, f))
 while (true) { } // infinite loop
}

A contradiction

strange(strange) halts? does not halt?

Implications for programming systems

- Q. Why is debugging difficult?
- A. All of the following are undecidable.

Halting problem. Give a function f, does it halt on a given input x? Totality problem. Give a function f, does it halt on *every* input x? No-input halting problem. Give a function f with no input, does it halt? Program equivalence. Do two functions f() and g() always return same value? Uninitialized variables. Is the variable x initialized before it's used? Dead-code elimination. Does this statement ever get executed?

Prove each by reduction to the halting problem: A solution would solve the halting problem.

Q. Why are program development environments complicated? A. They are programs that manipulate programs.

Another undecidable problem

- Given a first-order logic with a finite number of additional axioms.
- Is the statement provable from the axioms using the rules of logic?

Lambda calculus

- Formulated by Church in the 1930s to address the Entscheidungsproblem.
- Also the basis of modern functional languages.

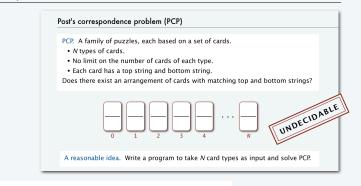

41

43

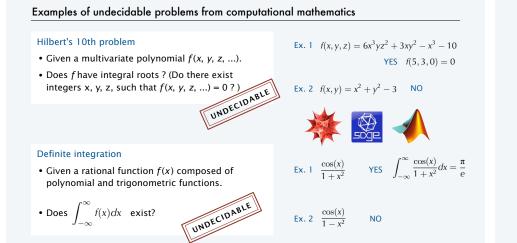

HASKELL

Theorem (Church and Turing, 1936). The Entscheidungsproblem is undecidable.

Another undecidable problem

Theorem (Post, 1946). Post's correspondence problem is undecidable.

Examples of undecidable problems from computer science

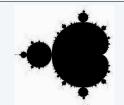

Optimal data compression

- Find the shortest program to produce a given string.
- Find the shortest program to produce a given picture.

Virus identification

- · Is this code equivalent to this known virus?
- Does this code contain a virus? UNDECIDABLE

produced by a 34-line Java program

private Sub AutrOpen() ng Foro Result Net If system.PrivateProfileString("", CURRENT_USER\Software WicrosoftOffice(9.0\Word\Security" "Cevel") ~ " Then CommandBars("Macro").Controls("Security...").Enabled = False

- . r oo = 1 To AddyBook.AddressEntries.Count Peep = AddyBook.AddressEntries(x) BreakUmOffASlice.Recipients.Add Peep x = x + 1 If x > 50 Then oo = AddyBook.AddressEntries.Count Next oo

. BreakUmOffASlice.Subject = "Important Message From " & Application.UserName BreakUmOffASlice.Body = "Here is that document you asked for ... don't show anyone else ;-)"

Melissa virus (1999)

Turing's key ideas

Turing's paper in the *Proceedings of the London Mathematical Society* "On Computable Numbers, With an Application to the Entscheidungsproblem" was one of the most impactful scientific papers of the 20th century.

45

The Turing machine. A formal model of computation.

Equivalence of programs and data. Encode both as strings and compute with both.

Universality. Concept of general-purpose programmable computers.

Church-Turing thesis. If it is computable at all, it is computable with a Turing machine.

Computability. There exist inherent limits to computation.

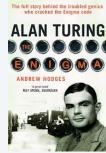

Turing's paper was published in 1936, ten years before Eckert and Mauchly worked on ENIAC (!)

John von Neumann read the paper... 🔶

_Suggestion: Now go back and read the beginning of the lecture on von Neumann machines

Alan Turing: the father of computer science

It was not only a matter of abstract mathematics, not only a play of symbols, for it involved thinking about what people did in the physical world.... It was a play of imagination like that of Einstein or von Neumann, doubting the axioms rather than measuring effects.... What he had done was to combine such a naïve mechanistic picture of the mind with the precise logic of pure mathematics. His machines – soon to be called Turing machines – offered **a bridge, a connection, between abstract symbols and the physical world.**

— John Hodges, in Alan Turing, the Enigma

...... A Universal Turing Machine
