

Texture

COS 429: Computer Vision

Texture

What is a texture?

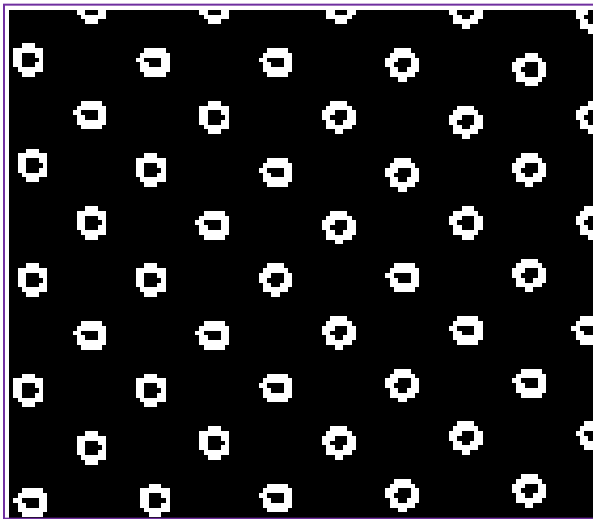

Texture

What is a texture?

Texture

What is a texture?

Texture

- Texture: *stochastic* pattern that is *stationary* (“looks the same” at all locations)
- May be structured or random

Texture

Stochastic

Stationary

Texture

Stochastic Stationary

Goal

- Computational representation of texture
 - Textures generated by same stationary stochastic process have same representation
 - Perceptually similar textures have similar representations

5, 7, 34, 2, 199, 12

Hypothetical texture representation

Applications

- Segmentation
- 3D Reconstruction
- Classification
- Synthesis

Input

Output

Texture Representation?

- What makes a good texture representation?
 - Textures generated by same stationary stochastic process have same representation
 - Perceptually similar textures have similar representations

Approaches

- Statistics of filter banks
- Textons
- Markov Random Fields

Approaches

- Statistics of filter banks
- Textons
- Markov Random Fields

Filter-Based Texture Representation

- Research suggests that the human visual system performs **local** spatial frequency analysis (Gabor filters)

J. J. Kulikowski, S. Marcelja, and P. Bishop.
Theory of spatial position and spatial frequency relations in the
receptive fields of simple cells in the visual cortex.
Biol. Cybern, 43:187-198, 1982.

Texture Representation

- Analyze textures based on the responses of linear filters
 - Use filters that look like patterns (spots, edges, bars, ...)
 - Compute magnitudes of filter responses
- Represent textures with statistics of filter responses within local windows
 - Histogram of feature responses for all pixels in window

Texture Representation Example

original image

derivative filter responses, squared

	<u>mean</u> <u>d/dx</u> <u>value</u>	<u>mean</u> <u>d/dy</u> <u>value</u>
Win. #1	4	10
	⋮	

statistics to summarize patterns in small windows

Filter Banks

- Previous example used two filters, resulting in 2-dimensional feature vector
 - x and y derivatives revealed local structure
- Filter bank: many filters
 - Higher-dimensional feature space
 - Distance still related to similarity of local structure

Filter banks

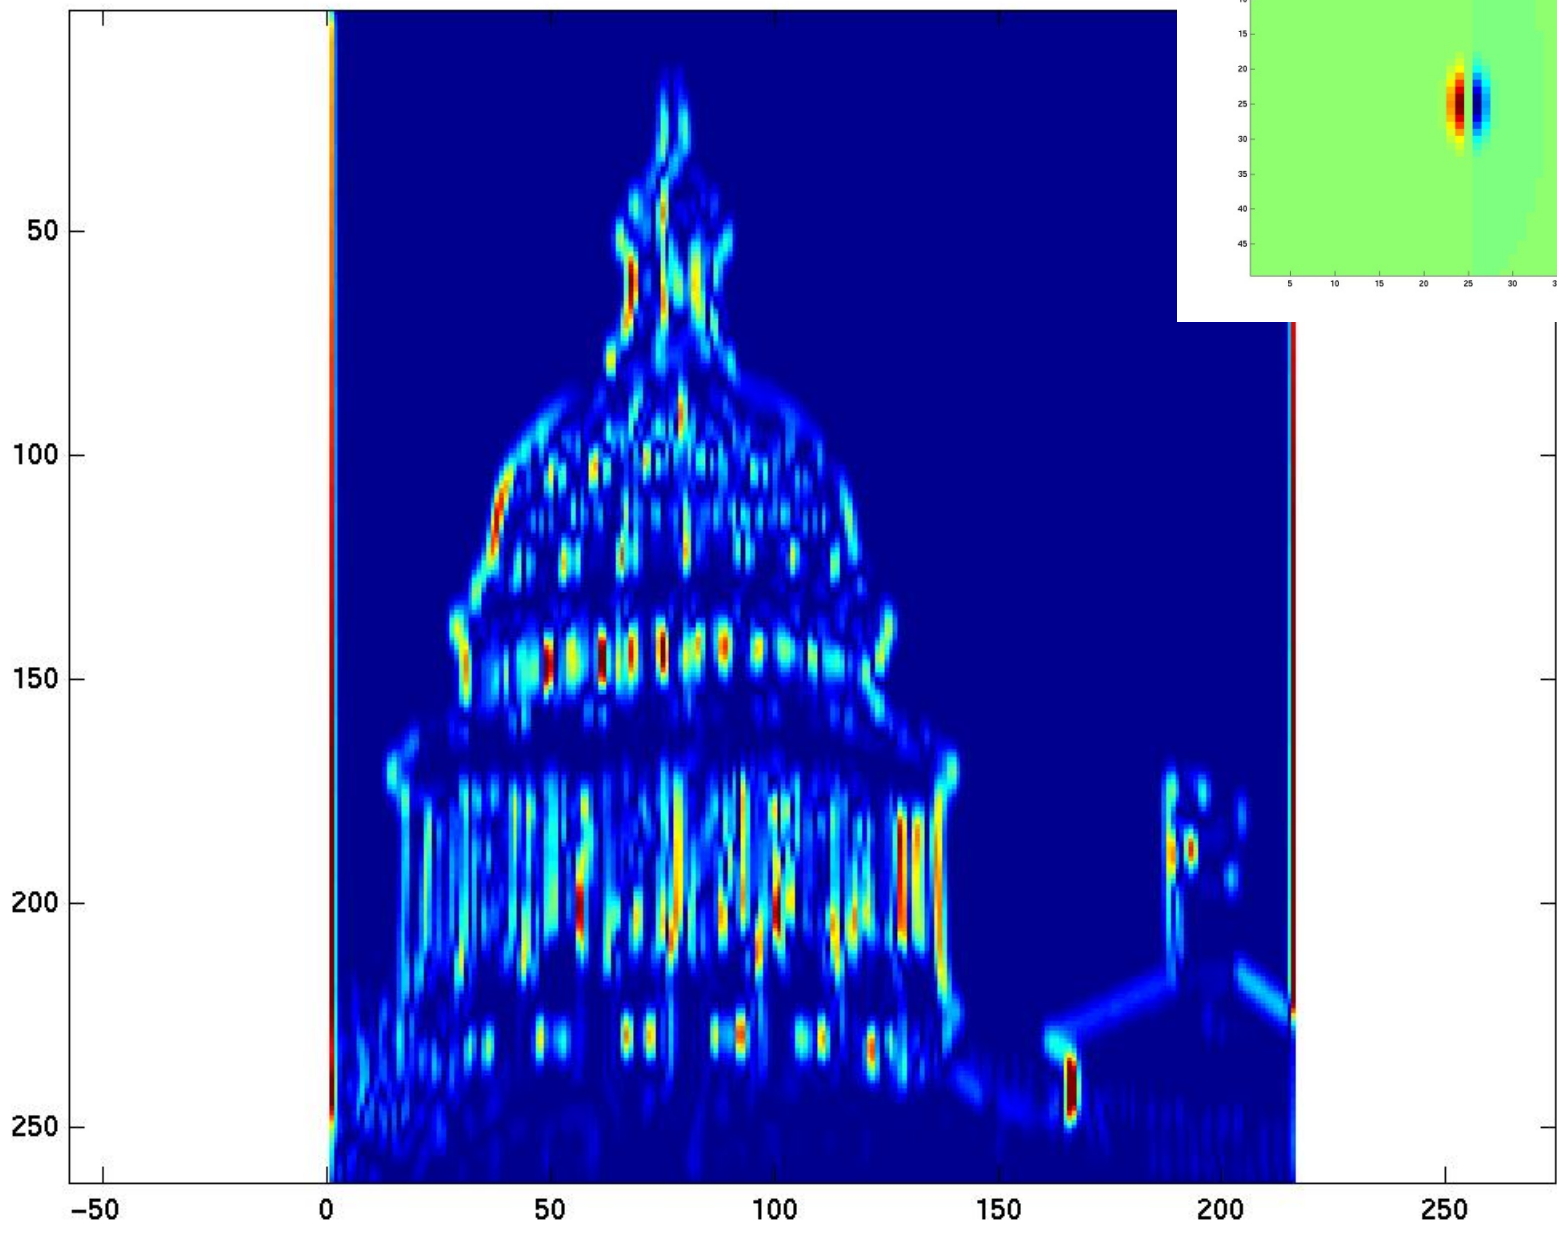

- What filters to put in the bank?
 - Combination of different scales, orientations, patterns

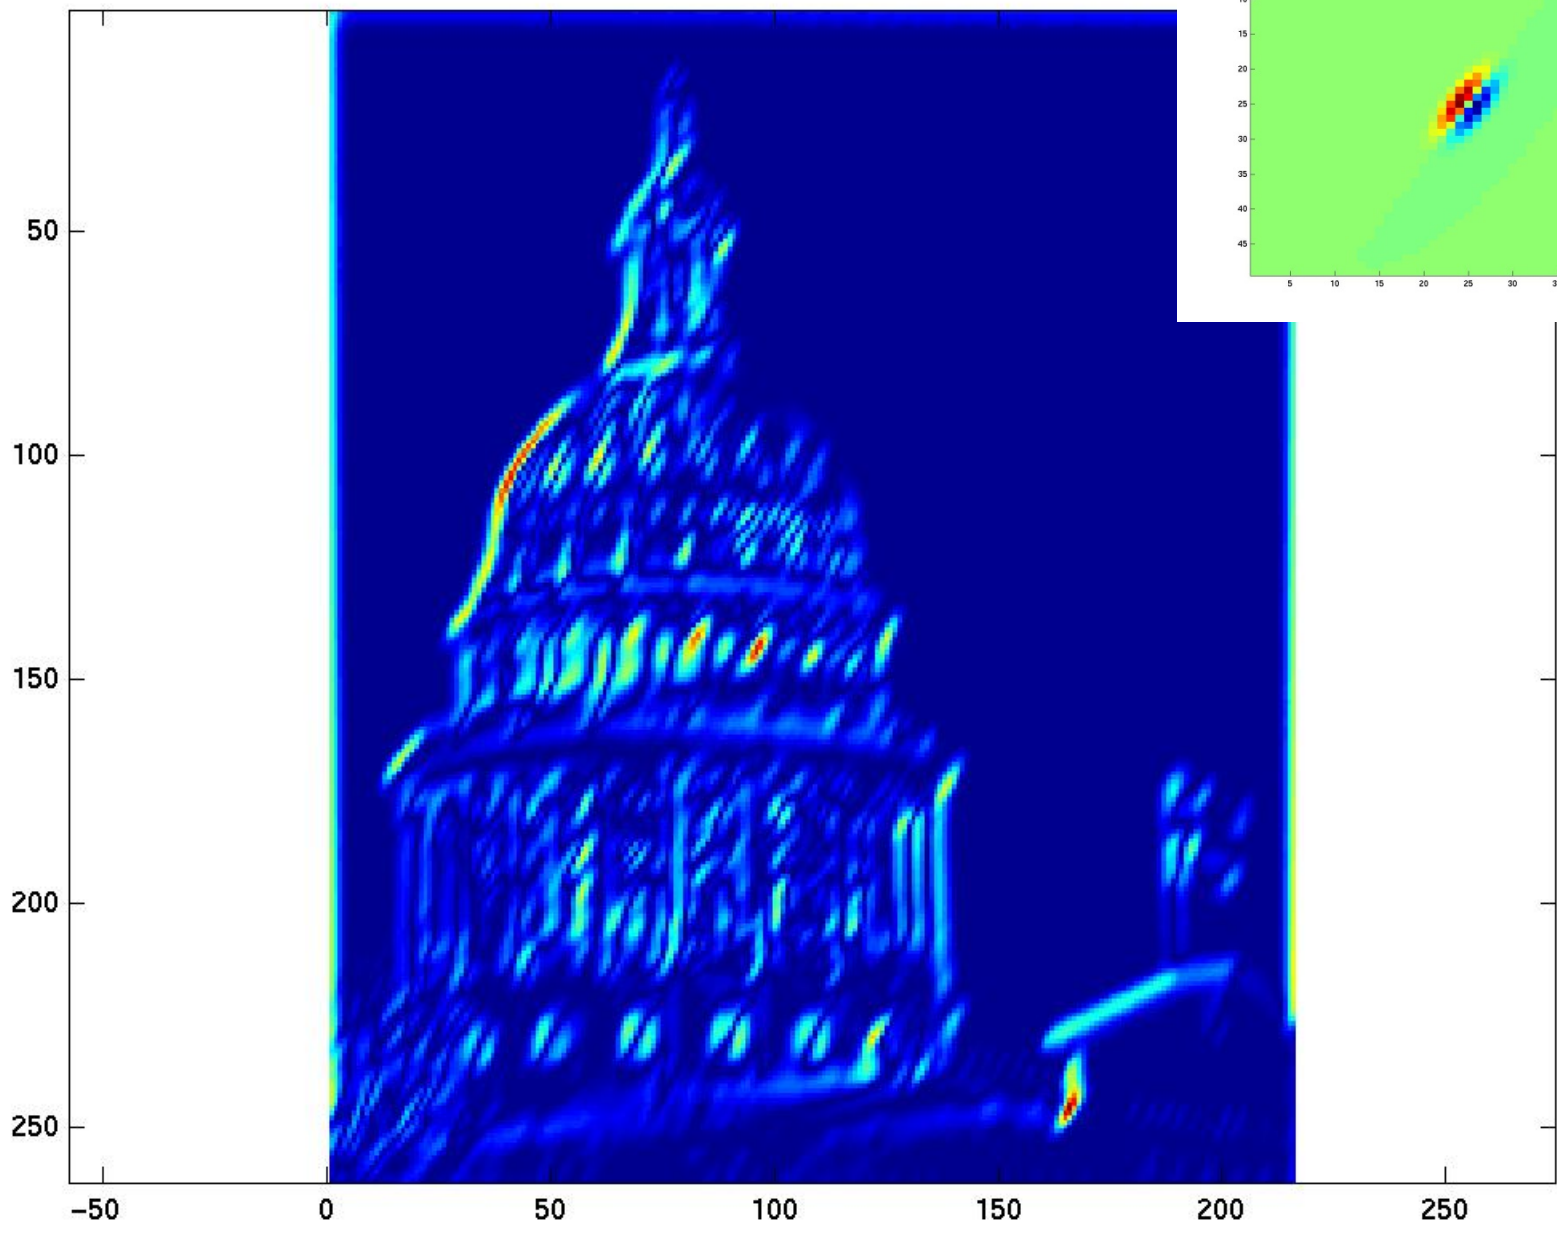

You Try: Can you match the texture to the response?

Filters

1

2

Mean abs responses

A

B

C

Filter Bank Texture Representation

- Pass image through filter bank
- **Analysis:** Compile statistics of filter outputs
 - Mean
 - Mean + variance
 - Histogram
- **Synthesis:**
 - Start with random noise image
 - Adjust histograms to match original image
 - Re-synthesize image from filter outputs

Histogram Equalization

- Given: two histograms of intensity H_1 and H_2

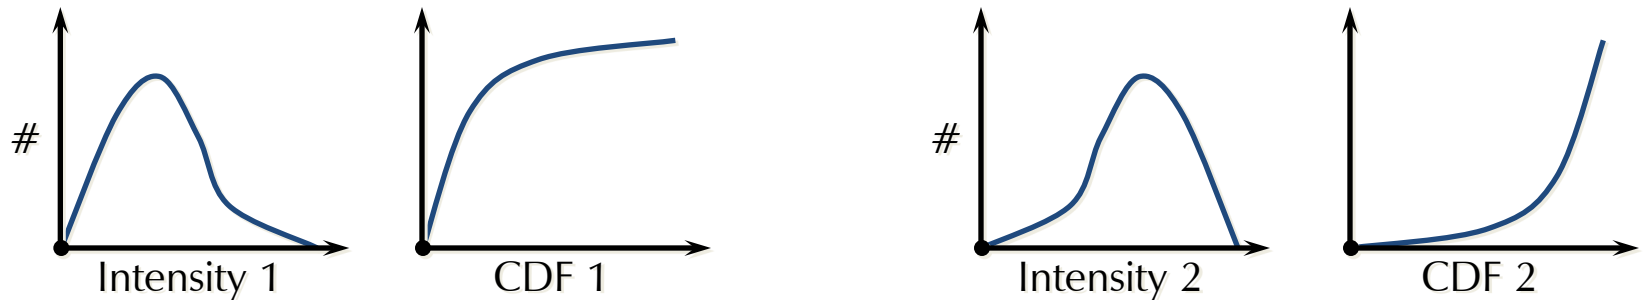

- Goal: function that remaps intensities to make new histogram H_1' equal H_2

Histogram Equalization

1. Compute CDFs (integrals) of histograms

2. For each intensity, map through CDF 1 then look up inverse in CDF 2

Application: Texture Synthesis

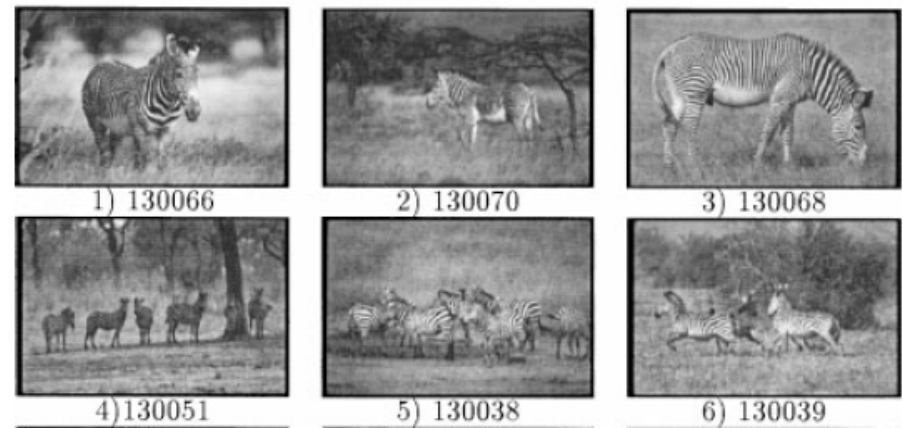

Original Texture

Synthesized Texture

Application: Retrieval

- Retrieve similar images based on texture

Y. Rubner, C. Tomasi, and L. J. Guibas. The earth mover's distance as a metric for image retrieval. *International Journal of Computer Vision*, 40(2):99-121, November 2000,

Approaches

- Statistics of filter banks
- Textons
- Markov Random Fields

Textons

- Elements (“textons”) either identical or come from some statistical distribution
- Can analyze in natural images

Clustering Textons

- Output of bank of n filters can be thought of as vector in n -dimensional space
- Can *cluster* these vectors using k -means [Malik et al.]
- Result: dictionary of most common textures

Clustering Textons

Image

Clustered Textons

Texton to Pixel Mapping

Using Texture in Segmentation

- Compute histogram of how many times each of the k clusters occurs in a neighborhood
- Define similarity of histograms h_i and h_j using χ^2

$$\chi^2 = \frac{1}{2} \sum_k \frac{(h_i(k) - h_j(k))^2}{h_i(k) + h_j(k)}$$

- Different histograms \rightarrow separate regions

Application: Segmentation

Approaches

- Statistics of filter banks
- Textons
- Markov Random Fields

Markov Random Fields

- Different way of thinking about textures
- Premise: probability distribution of a pixel depends on values of neighbors
- Probability the same throughout image
 - Extension of Markov chains

Motivation from Language

- Shannon (1948) proposed a way to synthesize new text using N-grams
 - Use a large text to compute probability distributions of each letter given $N-1$ previous letters
 - Starting from a seed repeatedly sample the conditional probabilities to generate new letters
 - Can do this with image patches!

Texture Synthesis Based on MRF

- For each pixel in destination:
 - Take already-synthesized neighbors
 - Find closest match in original texture
 - Copy pixel to destination
- Efros & Leung 1999
 - Speedup by Wei & Levoy 2000
 - Extension to copying whole blocks by Efros & Freeman 2001

Efros & Leung Algorithm

output image

- Compute output pixels in scanline order (top-to-bottom, left-to-right)

Efros & Leung Algorithm

- Find candidate pixels based on similarities of pixel features in neighborhoods

Efros & Leung Algorithm

- Similarities of pixel neighborhoods can be computed with squared differences (SSD) of pixel colors and/or filter bank responses

$$\| \left(\begin{array}{ccccc} \text{blue} & \text{light blue} & \text{light purple} & \text{purple} & \text{dark purple} \\ \text{blue} & \text{light blue} & \text{light purple} & \text{purple} & \text{dark purple} \\ \text{blue} & \text{light blue} & \text{light purple} & \text{purple} & \text{dark purple} \\ \text{black} & \text{black} & \text{black} & \text{black} & \text{black} \end{array} - \begin{array}{ccccc} \text{blue} & \text{light blue} & \text{light purple} & \text{purple} & \text{dark purple} \\ \text{blue} & \text{light blue} & \text{light purple} & \text{purple} & \text{dark purple} \\ \text{blue} & \text{light blue} & \text{light purple} & \text{purple} & \text{dark purple} \\ \text{black} & \text{black} & \text{black} & \text{black} & \text{black} \end{array} \right) \| ^2$$

Efros & Leung Algorithm

- For each pixel p :
 - Find the best matching K windows from the input image
 - Pick one matching window at random
 - Assign p to be the center pixel of that window

Hole Filling

- Fill pixels in “onion skin” order
 - Within each “layer”, pixels with most neighbors are synthesized first
 - Normalize error by the number of known pixels
 - If no close match can be found, the pixel is not synthesized until the end

Hole Filling

Extrapolation
