

# Laplacian Meshes

COS 526 – Fall 2016

Slides from Olga Sorkine and Yaron Lipman

# Outline

- Differential surface representation
- Ideas and applications
  - Compact shape representation
  - Mesh editing and manipulation
  - Membrane and flattening
  - Generalizing Fourier basis for surfaces

# Motivation

- Meshes are great, but:
  - Geometry is represented in a *global* coordinate system
    - Single Cartesian coordinate of a vertex doesn't say much

# Laplacian Mesh Editing

- Meshes are difficult to edit

# Motivation

- Meshes are difficult to edit

# Motivation

- Meshes are difficult to edit

# Differential coordinates

- Represent a point *relative* to it's neighbors.
- Represent *local detail* at each surface point
  - better describe the shape
- Linear transition from global to differential
- Useful for operations on surfaces where surface details are important

# Differential coordinates

“Local control for mesh morphing”, Alexa 01

- Detail = surface – *smooth*(surface)
- Smoothing = averaging

$$\delta_i = \mathbf{v}_i - \frac{1}{d_i} \sum_{j \in N(i)} \mathbf{v}_j$$

$$\delta_i = \sum_{j \in N(i)} \frac{1}{d_i} (\mathbf{v}_i - \mathbf{v}_j)$$

# Connection to the smooth case

- The direction of  $\delta_i$  approximates the normal
- The size approximates the mean curvature

$$\delta_i = \frac{1}{d_i} \sum_{\mathbf{v} \in N(i)} (\mathbf{v}_i - \mathbf{v})$$

$$\frac{1}{\text{len}(\gamma)} \int_{\mathbf{v} \in \gamma} (\mathbf{v}_i - \mathbf{v}) ds$$

$$\lim_{\text{len}(\gamma) \rightarrow 0} \frac{1}{\text{len}(\gamma)} \int_{\mathbf{v} \in \gamma} (\mathbf{v}_i - \mathbf{v}) ds = H(\mathbf{v}_i) \mathbf{n}_i$$

# Laplacian matrix

The mesh

4	-1	-1	-1	-1					
-1	3	-1	-1						
-1	-1	5	-1	-1	-1				
	-1	-1	4		-1				-1
-1				3	-1		-1		
-1	-1				4	-1	-1		
		-1	-1		-1	6	-1	-1	-1
				-1	-1	-1	6	-1	-1
						-1	-1	3	-1
			-1			-1	-1	-1	4

The symmetric Laplacian  $L_S$

# Weighting schemes

$$\delta_i = \frac{\sum_{j \in N(i)} w_{ij} (\mathbf{v}_i - \mathbf{v}_j)}{\sum_{j \in N(i)} w_{ij}}$$

- Ignore geometry

$$\delta_{\text{umbrella}} : w_{ij} = 1$$

- Integrate over circle around vertex

$$\delta_{\text{mean value}} : w_{ij} = \tan \phi_{ij}/2 + \tan \phi_{ij+1}/2$$

- Integrate over Voronoi region of vertex

$$\delta_{\text{cotangent}} : w_{ij} = \cot \alpha_{ij} + \cot \beta_{ij}$$

# Laplacian mesh

- Vertex positions are represented by Laplacian coordinates  $(\delta_x \delta_y \delta_z)$

$$\delta_i = \sum_{j \in N(i)} w_{ij} (\mathbf{v}_i - \mathbf{v}_j)$$

$\mathbf{L}$	$\mathbf{v}_x$	=	$\delta_x$
$\mathbf{L}$	$\mathbf{v}_y$	=	$\delta_y$
$\mathbf{L}$	$\mathbf{v}_z$	=	$\delta_z$

# Basic properties

- $\text{rank}(L) = n - c$  ( $n - 1$  for connected meshes)
- We can reconstruct the  $xyz$  geometry from  $\delta$  up to translation

$$\begin{array}{|c|} \hline \mathbf{L} \\ \hline 1 \\ \hline \end{array} \begin{array}{|c|} \hline \mathbf{v}_x \\ \hline \end{array} = \begin{array}{|c|} \hline \delta_x \\ \hline \mathbf{c}_x \\ \hline \end{array}$$

$$\begin{array}{|c|} \hline \mathbf{L} \\ \hline 1 \\ \hline \end{array} \begin{array}{|c|} \hline \mathbf{v}_y \\ \hline \end{array} = \begin{array}{|c|} \hline \delta_y \\ \hline \mathbf{c}_y \\ \hline \end{array}$$

$$\begin{array}{|c|} \hline \mathbf{L} \\ \hline 1 \\ \hline \end{array} \begin{array}{|c|} \hline \mathbf{v}_z \\ \hline \end{array} = \begin{array}{|c|} \hline \delta_z \\ \hline \mathbf{c}_z \\ \hline \end{array}$$

# Reconstruction

$$\begin{array}{c} \mathbf{L} \\ 1 \\ 1 \end{array} \mathbf{v}_x = \begin{array}{c} \delta_x \\ \mathbf{c}_x \\ \mathbf{e}_x \end{array}$$

$$\begin{array}{c} \mathbf{L} \\ 1 \\ 1 \end{array} \mathbf{v}_y = \begin{array}{c} \delta_y \\ \mathbf{c}_y \\ \mathbf{e}_y \end{array}$$

$$\begin{array}{c} \mathbf{L} \\ 1 \\ 1 \end{array} \mathbf{v}_z = \begin{array}{c} \delta_z \\ \mathbf{c}_z \\ \mathbf{e}_z \end{array}$$

# Reconstruction

---

$$\begin{bmatrix} L \\ 1 \\ 1 \end{bmatrix} \mathbf{v}_x = \begin{bmatrix} \delta_x \\ \mathbf{c}_x \\ \mathbf{e}_x \end{bmatrix}$$

$$\tilde{\mathbf{x}} = \arg \min_{\mathbf{x}} \left( \left\| L\mathbf{x} - \delta_x \right\|^2 + \sum_{s=1}^k |x_k - c_k|^2 \right)$$

# Reconstruction

---

$$\begin{array}{|c|} \hline \mathbf{L} \\ \hline 1 \\ \hline 1 \\ \hline \end{array} \mathbf{v}_x = \begin{array}{|c|} \hline \delta_x \\ \hline \mathbf{c}_x \\ \hline \mathbf{e}_x \\ \hline \end{array}$$

$$\mathbf{A} \mathbf{x} = \mathbf{b}$$

Normal Equations:

$$\mathbf{A}^T \mathbf{A} \mathbf{x} = \mathbf{A}^T \mathbf{b}$$

$$\mathbf{x} = \underbrace{(\mathbf{A}^T \mathbf{A})^{-1}}_{\text{compute once}} \mathbf{A}^T \mathbf{b}$$

# Cool underlying idea

- Mesh vertex positions are defined by minimizer of an objective function

$$\begin{array}{c} \text{L} \\ 1 \\ 1 \end{array} \mathbf{v}_x = \begin{array}{c} \delta_x \\ \mathbf{c}_x \\ \mathbf{e}_x \end{array}$$

$$\tilde{\mathbf{x}} = \arg \min_{\mathbf{x}} \left( \left\| \mathbf{L}\mathbf{x} - \delta_x \right\|^2 + \sum_{s=1}^k |x_k - c_k|^2 \right)$$

# What we have so far

---

- Laplacian coordinates  $\delta$ 
  - Local representation
  - Translation-invariant
- Linear transition from  $\delta$  to  $xyz$ 
  - can constrain more than 1 vertex
  - least-squares solution

# Editing using differential coordinates

- The editing process from the user's point of view:
  - 1) First, a ROI , anchors and a handle vertex should be set.
  - 2) Then the edit is Performed By moving this vertex.

# Editing using differential coordinates

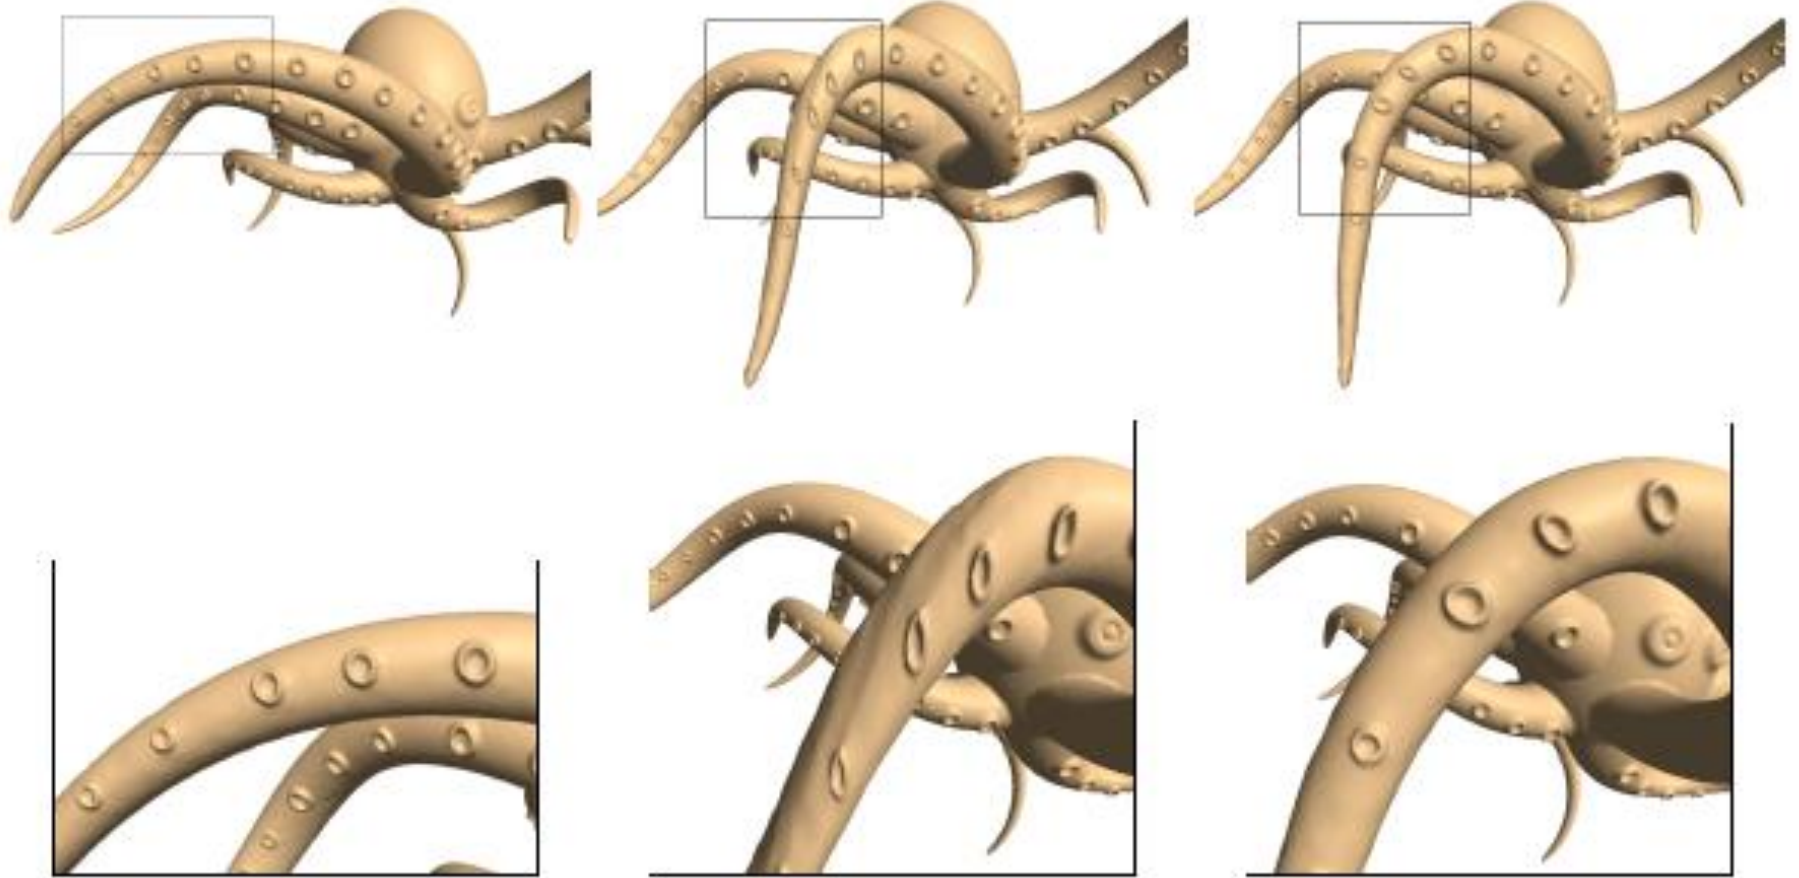

- The user moves the handle and **interactively** the surface changes.
- The stationary anchors are responsible for **smooth transition** of the edited part to the rest of the mesh.
- This is done using increasing weight with geodesic distance in the **soft** spatial equations.

# Mesh Editing Example

---

# Mesh Editing Example

---

# What else can we do with it?

.

# Parameterization

- Use zero Laplacians.

$$\begin{array}{c} \mathbf{L} \\ \hline 1 \\ \hline 1 \\ \hline 1 \end{array} \mathbf{V} = \begin{array}{c} 0 \\ \hline c_1 \\ \hline c_2 \\ \hline c_k \end{array}$$
