Written Exam 1

Instructions. This exam has 7 questions, worth 10 points each. You have 50 minutes.

Resources. You may reference your optional one-sided 8.5-by-11 handwritten "cheat sheet" during this exam. You may not use the textbook, your notes, or any electronic devices. You may not communicate with anyone except the course staff during this exam.

Discussing this exam. Due to travel for extracurriculars and sports, some of your peers will take this exam next week. Do not discuss its contents with anyone who has not taken it.

This paper. Do not remove this exam from the exam room. You may fill in this page now.

Question 1	Data Types	10 points
------------	------------	------------------

What do the following Java expressions evaluate to? If an expression does not compile or causes an exception at runtime, put an ${\bf X}$ in both columns.

Expression	Value	Туре
"1" + 2 * 6		
1 / 2 / 6		
Integer.parseInt(12) * 6		
(1 >= 26) (12 >= 6)		
(int) 1.26 / (double) 10		
1.2e6 % 1.2e5		
1 <= 2 < 6		
Math.min(1.2e6, 1.2e7, 1.2e8)		
true != false && true > false		

!!!!!!false

Select the term that best matches each statement below. You may use each term once, more than once, or not at all.

		A. int
1.	Data type used to store large whole numbers precisely.	B. double
		C. short
2.	Specifies a function's name, arguments, and return type.	D. long
		E. float
		F. curly braces
3.	Used to override precedence of arithmetic operators.	G. square brackets
		H. parentheses
4	Specifies that a function does not return anything.	I. for loop
4.	specifies that a function does not return anything.	J. while loop
		K. statement
5.	Result of calling a recursive function with no base cases.	L. signature
		M. semicolon
		N. public
6.	Not required for a loop with a single statement.	O. private
		P. void
7.	Causes program to leave a loop immediately.	Q. null
,,	causes program to reave a loop immediately.	R. default
		S. static
8.	Causes program to leave a function immediately.	T. break
		U. return
9.	A type of error that is not a run-time or logic error.	V. true
9.	A type of error that is not a fair-time of logic error.	W. false
		X. StackOverflowError
10.	Defines variable scope.	Y. infinite loop
		Z. compilation error

3.

runtime error or infinite loop

Ono error; the output is: _____

Next to each piece of code, either mark the kind of error, or mark "no error" and write what is printed.

Assume that: boolean A = false; boolean B = true; boolean C = false;

NOTE: The variables A, B, and C are reset to their original values before running the code below.

if (C == false) B = false;

StdOut.println(B);

```
for (int i = 0; i < 100; i++) {
    boolean temp = A;
    A = B;
    B = temp;
}
StdOut.println(A);</pre>
compilation error
    runtime error or infinite loop
    no error; the output is:
```

```
for (boolean D = true; C == D;)

D = false;

StdOut.println(D);

Compilation error

O runtime error or infinite loop

O no error; the output is:
```

Determine whether each statement below is true or false. Assume no index is out of bounds. Write either "true" or "false" on each line.

For parts 8-11: int[] a = new int[6]; int[] b = new int[6]; int[] c = a; c[0] = 3;

1. Every element in a new array of integers is initialized to 0.

true

- **2.** Every element in a new array of booleans is initialized to true.
- **3.** N-1 is the last valid index into an array of size N.
- **4.** 0 is the index of the smallest element in an array of size N.
- **5.** N-3 is the index of the third-to-last element in an array of size N.
- **6.** (int) (Math.random()*N) is the index of a random element in an array of size N.
- **7.** You can create a new array without using the new keyword.
- **8.** Given the arrays a, b, and c as defined above, a == b evaluates to true.
- **9.** Given the arrays a, b, and c as defined above, a == c evaluates to true.
- **10.** Given the arrays a, b, and c as defined above, a [b[0]] evaluates to 0.
- **11.** Given the arrays a, b, and c as defined above, a [b[c[0]]] evaluates to 0.

What do each of the following functions return? Fill in the tables below.

Assume that the arrays x, y, and z are defined as follows:

```
int[] x = new int[5]; int[] y = {1, 2, 6}; int[] z = {-10, 0, 10};
```

```
public static int f(int[] a) {
    int t = 0;
    int n = a.length;
    for (int i = 0; i < n; i++)
        t += a[i];
    return t;
}</pre>
```

f(x)	f(y)	f(z)

```
public static int g(int[] a) {
   int n = a.length;
   for (int i = 0; i < n; i++)
       a[i] = a[n-i-1];
   return f(a);
}</pre>
```

g (x)	g (y)	g(z)

NOTE: The arrays x, y, and z are reset to their original values before calling h ().

```
public static int h(int[] a) {
   int n = a.length;
   for (int i = 0; i < n; i++)
       a[i] = f(a);
   return f(a);
}</pre>
```

h(x)	h (y)	h(z)

Consider the following program.

```
public class WordSmith {
   public static String choose(String str1, String str2) {
        // the .length() method returns the number of characters in a String
        if (str1.length() > str2.length())
            return str1;
        return str2;
   }
   public static void main(String[] args) {
        while (!StdIn.isEmpty()) {
            String word1 = StdIn.readString();
            String word2 = StdIn.readString();
            StdOut.print(choose(word1, word2) + " ");
        }
    }
}
```

The file michelle.txt contains the following quote:

```
It was clear to me that if I could get through Princeton at the top of my class, I could do anything in the world. -- Michelle Obama
```

What is printed when the user runs the following commands?

```
% java-introcs WordSmith < michelle.txt
```

```
% java-introcs WordSmith < michelle.txt | java-introcs WordSmith</pre>
```

This program produces the circles in the image below. Which circle is drawn first? Which is second? In each blank square, write the order the circles will appear. Use each number, 1 to 7, exactly once.

```
public class Circular {
   public static void horiz(int n, double x, double y, double r) {
      if (n == 0) return;
      vert(n - 1, x + r/2, y, r/2); // recur right
      vert(n - 1, x - r/2, y, r/2); // recur left
      StdDraw.circle(x, y, r);
   }
   public static void vert(int n, double x, double y, double r) {
      if (n == 0) return;
      horiz(n - 1, x, y + r/2, r/2); // recur up
      StdDraw.circle(x, y, r);
      horiz(n - 1, x, y - r/2, r/2); // recur down
   }
   public static void main(String[] args) {
      vert(3, .5, .5, .5);
   }
}
```
