## COS 435: Collaborative filtering equations given in class 4/13/06

$r(u, i)=$ rating of $i^{\text {th }}$ item by user $u$
$\mathrm{I}_{\mathrm{u}}=$ set of items rated by user $u$
$I_{u, v}=$ set of items rated by both users $u$ and $v$

$$
\begin{aligned}
& r_{u}^{\text {avg }}=\left(1 /\left|I_{u}\right|\right) * \sum_{i \text { in } I_{u}} r(u, i) \\
& \quad \sum_{i \text { in } I_{u, v}}\left(r(u, i)-r_{u}{ }^{\text {avg }}\right)\left(r(v, i)-r_{v}^{\text {avg }}\right)
\end{aligned}
$$

average rating by user $u$
$\operatorname{sim}(u, v)=$ $\qquad$ similarity between users $u$ and $v$ (Pearson correlation coefficient)

$$
\left(\sum_{i \text { in }}\left(r(u, i)-r_{u}{ }_{u}^{\text {avg }}\right)^{2} \sum_{i \text { in } I_{u, v}}\left(r(v, i)-r_{v}^{\text {avg }}\right)^{2}\right)^{1 / 2}
$$

$$
\sum_{\mathrm{v} \text { in } \mathrm{S}} \operatorname{sim}(\mathrm{u}, \mathrm{v}) *\left(\mathrm{r}(\mathrm{v}, \mathrm{i})-\mathrm{r}_{\mathrm{v}}^{\text {avg }}\right)
$$

$r^{\text {pred }}(\mathrm{u}, \mathrm{i})=\mathrm{r}_{\mathrm{u}}^{\text {avg }}+\ldots \quad$ predicted rating of ith item
by user u

$$
\sum_{\mathrm{v} \text { in } \mathrm{S}}|\operatorname{sim}(\mathrm{u}, \mathrm{v})|
$$

where $S$ is either the set of all users other than $u$ or a set of "most similar users" to $u$. For Problem Set 4, take $S$ to be all users other than $u$.
