The science that drives modern computers.

COS 116: 4/8/2008

Sanjeev Arora

Changing face of manufacturing

1936

Late 20th century

"Modern Times"

Silicon wafer fabrication

20th century science and IT: a match made in heaven?

"These are the days of miracles and wonders." – Paul Simon, Graceland

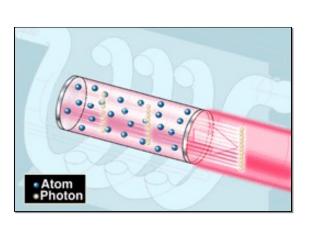

Main theme in this lecture:

Scientific Advances→ Ability to control matter precisely

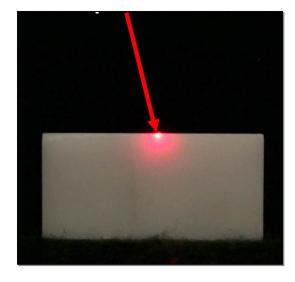

→ Amazing products/computers

Example of precise control of matter: Lasers

 Quantum mechanics (wave-particle duality, quantization of energy, etc.)

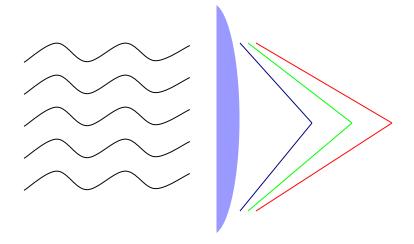

Ability to create light of a single frequency ("laser")

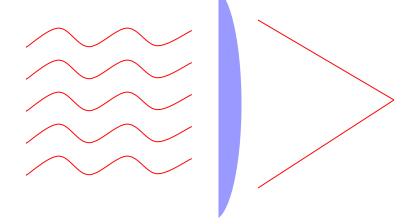

Why lasers are so useful: Accurate focusing

White light

Laser

 Different colors focus at different points – "smudge" Focus at single point

Silicon Chip manufacturing

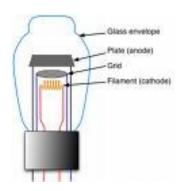

"A picture is worth a billion gates."

Fact: Modern chips are manufactured using a process similar to photography

Timeline

Vacuum Tube Triode (1908)

Transistor 1947 (silicon, germanium)

Very Large Scale Integrated (VLSI) Circuits; 1970s--(> 1,000 transistors per chip)

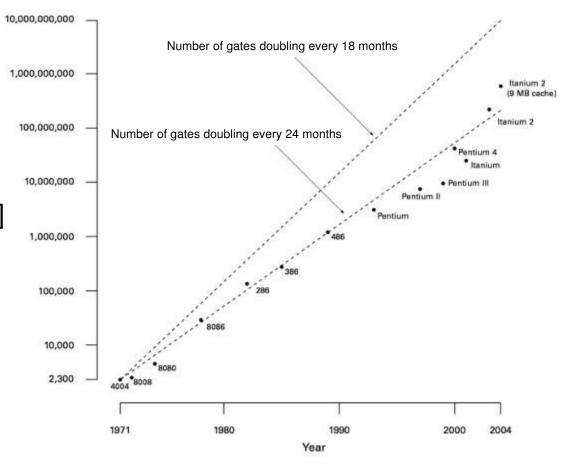

Intel Itanium (Tukwila)

2008: 2 billion transistors

Technology advances so that number of gates per square inch doubles every 18 months.

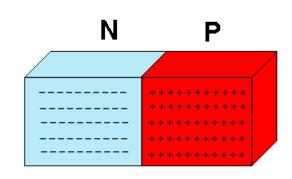

[Gordon Moore 1965]

7

Implementation of a gate in a modern chip

- Semiconductor:
 - not as good a conductor as metals, not as bad as wood
 - Example: silicon

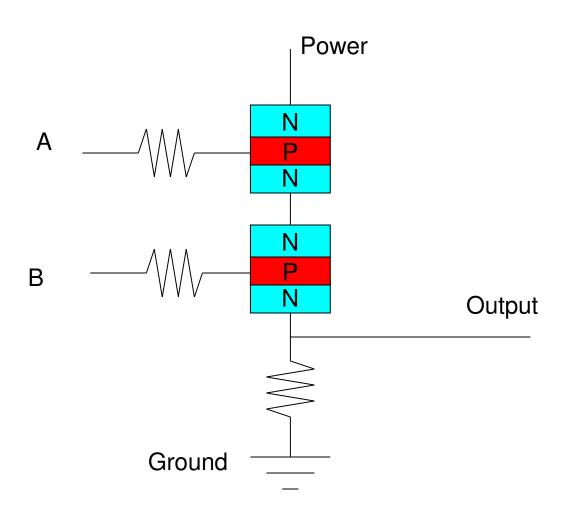

P-TYPE

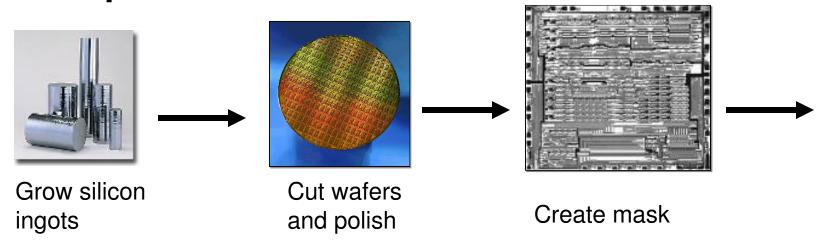

METAL

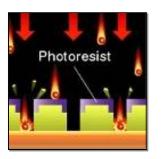

- Doped semiconductor:
 - semiconductor with some (controlled) impurities:
 - p-type, n-type
- Switch: p-n junction

Example: an AND gate

Chip Fabrication

Coat wafer with light sensitive chemicals and project mask onto it

Repeat to add metal channels (wires) and insulation; many layers!

Coat with chemicals that remove parts unexposed to light

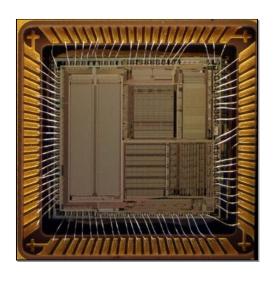

Aside: Lasik eye correction

Uses laser invented for chip fabrication

Chip Packaging

Inside

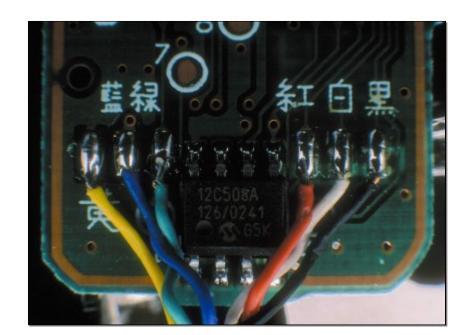

Outside

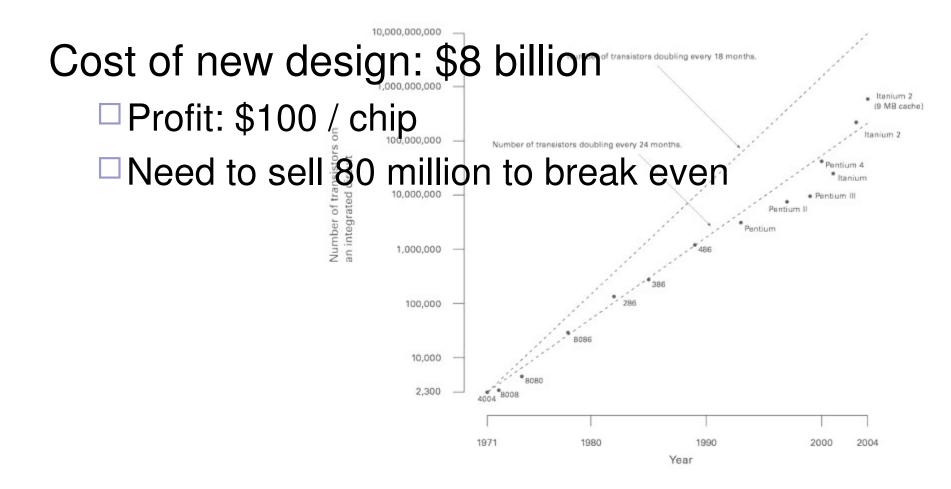

Life cycle of a microprocessor

Fact: Less than 1% of microprocessors sold are used in computers

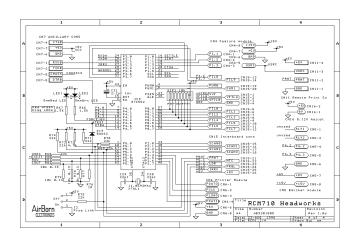

Inside an iPod Remote

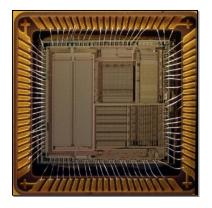

Why so few new CPU's?

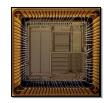

Engineering tradeoffs

36 months later...

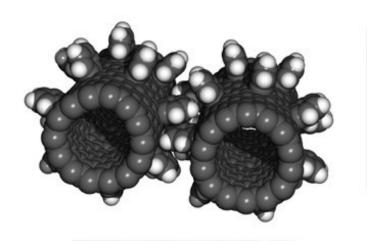

Half the size!

- Can run at twice the clock speed! (Why?)
- But: higher clock speeds → much more heat!

Even more precise control of matter

Nanotechnology: manufacture of objects (machines, robots, etc.) at the atomic or molecular level (1-100 nanometers)

"nanogear"

Biocomputing: Implementing computers via interactions of biological molecules.

Another example of control of matter: the changing data cable

Serial cable: 115 kb/s

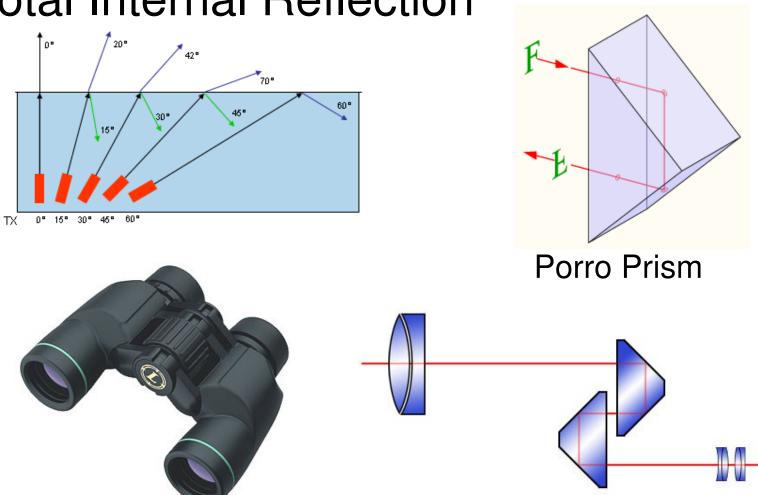

■ USB cable: 480 Mb/s (USB 2.0)

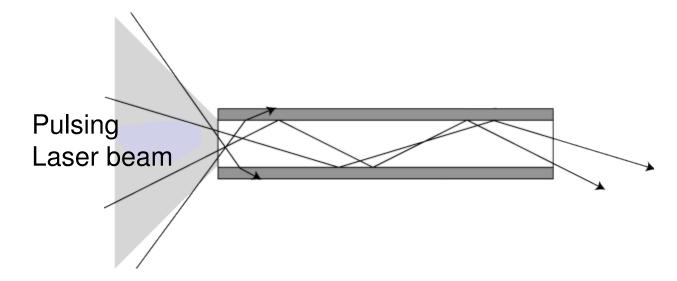

Fiber optic cable: 40 Gb/s

Total Internal Reflection

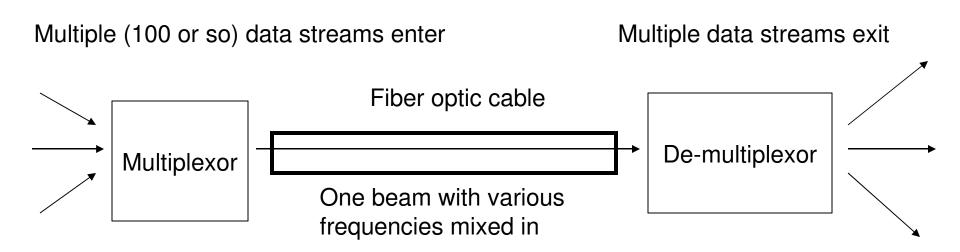

Glass fiber: 10-40 billion bits/s

"Total internal reflection"

Wave Division Multiplexing (WDM)

Transmission rates of trillion ("Tera") bits/s

Thoughts about the 20th century

- What factors (historical, political, social) gave rise to this knowledge explosion?
- Will it continue in the future?

As we know,
There are known knowns.
There are things we know we know.
We also know
There are known unknowns.
That is to say
We know there are some things
We do not know.
But there are also unknown unknowns,
The ones we don't know
We don't know.

Are faster chips the answer to all problems in computing?

An Answer:

No! Halting problem is undecidable!

re.

What about this <u>decidable</u> problem?

$$(A + B + C) \cdot (\overline{D} + F + G) \cdot (\overline{A} + G + K) \cdot (\overline{B} + P + Z) \cdot (C + \overline{U} + \overline{X})$$

- Does it have a satisfying assignment?
- What if instead we had 100 variables?
- 1000 variables?
