What computers just *cannot* do.

COS 116: 2/28/2008

Sanjeev Arora

Administrivia

- In-class midterm in midterms week; Thurs Mar 13 (closed book; ?
- No lab in midterms week; review session instead.

“What computers can’t do.”

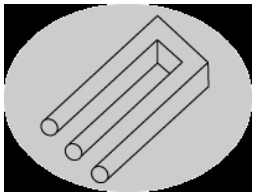
“Prof, what’s with all the negative thinking?!?”

- An obvious motivation:
  Understand the limits of technology

The power of negative thinking….

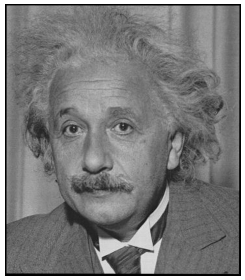
In Science….

Often, impossibility result → deep insight



Examples

- Impossibility of trisecting angle with ruler and compass (Galois) → Group Theory and much of modern math



- Nothing travels faster than light → Relativity and modern physics

In Mathematics…..

"Can mathematicians be replaced by machines?"

[Hilbert, 1900]

Math is axiomatic

Axioms – Set of statements

Derivation rules – finite set of rules for deriving new statements from axioms

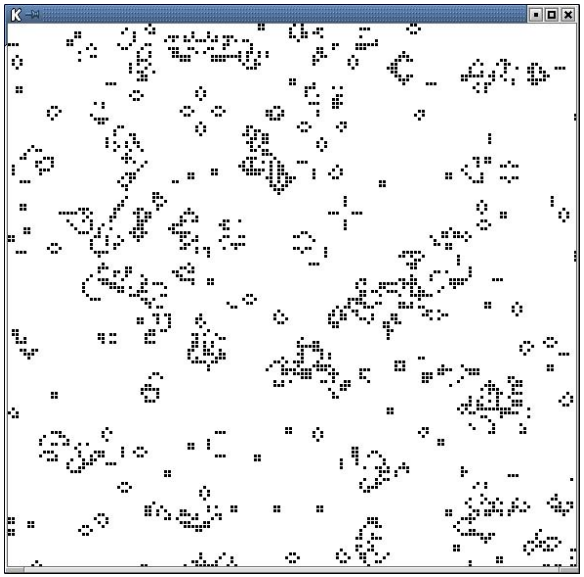
Theorems – Statements that *can* be derived from axioms in a finite number of steps

Mathematician – Person who tries to determine whether or not a statement is a theorem.

Understanding complex (or even simple) systems….

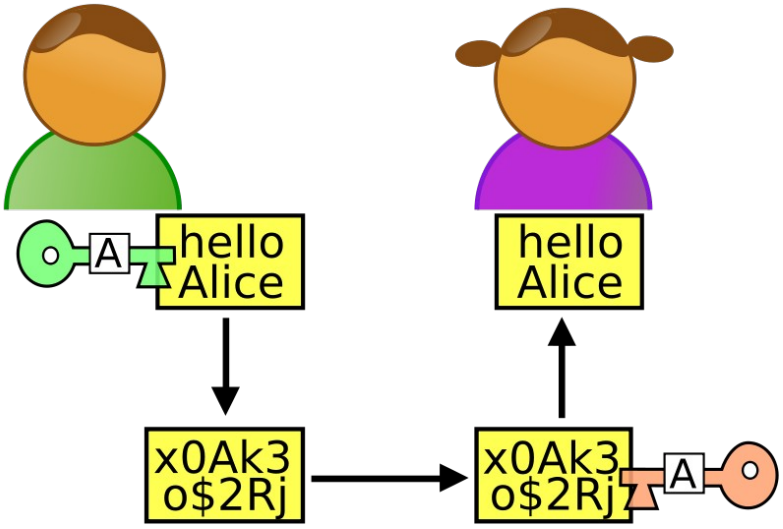
Can a simple set of mathematical equations “solve” problems like:

“Given starting configuration for the game of life, determine whether or not cell (100,100) is ever occupied by a critter.”



John Conway

In computer science……



CAPTCHA (CMU Group)
Computer generated test that Computers (at least with current algorithmic knowledge) seem unable to solve pass.

Cryptography

More Computer Science…

Automated Checking of Software?

Windows XP: 40 million line program

Can computers check whether or not it will ever crash?

Discussion Time

What is a computation?

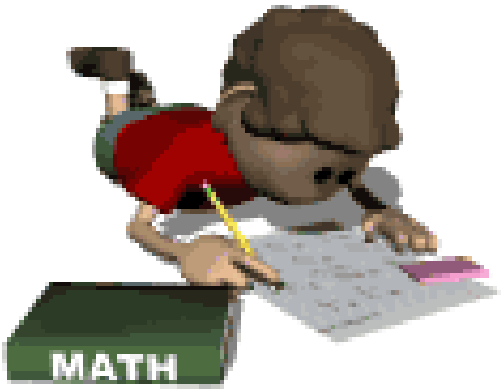
How did Turing set about formalizing this age-old notion and what were the features of his model?

What is a computation?

A formalization of an age-old notion

Basic Elements

- **Scratch Pad**
- **Step-by-step description of what to do ("program"); should be finite!**
- **At each step:**
  - **Can only scan a fixed number of symbols**
  - **Can only write a fixed number of symbols**



Turing's model

- 1 dimensional unlimited scratchpad ("infinite")
- Only symbols are 0/1 (tape has a finite number of 1s)
- Can only scan/write one symbol per step
- Program looks like →

1. PRINT 0
2. GO LEFT
3. GO TO STEP 1 IF 1 SCANNED
4. PRINT 1
5. GO RIGHT
6. GO TO STEP 5 IF 1 SCANNED
7. PRINT 1
8. GO RIGHT
9. GO TO STEP 1 IF 1 SCANNED
10. STOP

The Doubling Program

Example: What does this program do?

1. PRINT 0
2. GO RIGHT
3. GO TO STEP 1 if 1 SCANNED
4. GO TO STEP 2 if 0 SCANNED

Discussion Time

Can this computational model do every computation that pseudocode can?

How do we implement arithmetic instructions, arrays, loops?

Surprising facts about this “Micky-mouse” model

- It can do everything that pseudocode can

Hence it can “simulate” any other physical system, and in particular simulate any other physically realizable “computer.”

[CHURCH-TURING THESIS]

THIS MODEL CAPTURES THE NOTION OF “COMPUTATION” ----TURING

Recall: Numbers and letters can be written in binary.

A program can also be represented by a string of bits!

“Code” for a program

= Binary Representation

Many conventions possible (e.g., ASCII)

Davis’s convention:

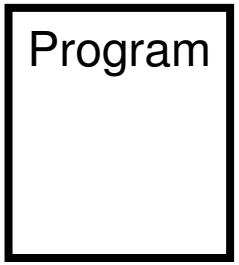
Code	Instruction
000	PRINT 0
001	PRINT 1
010	GO LEFT
011	GO RIGHT
$1010\underbrace{\ldots}_{i}01$	GO TO STEP i IF 0 IS SCANNED
$1101\underbrace{\ldots}_{i}10$	GO TO STEP i IF 1 IS SCANNED
100	STOP

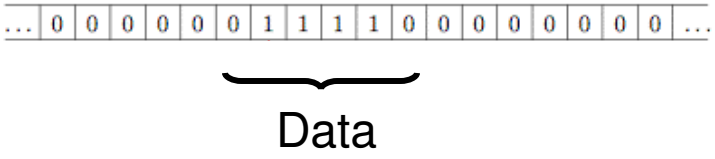
P ⟷ Code (P)

Programs and Data

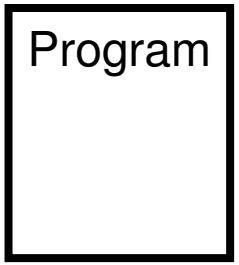
A False Dichotomy!

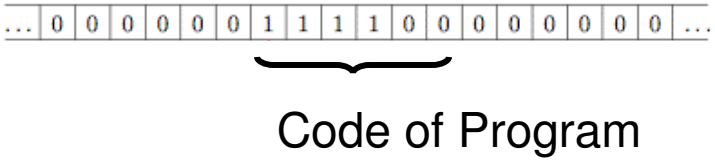
Usual viewpoint -



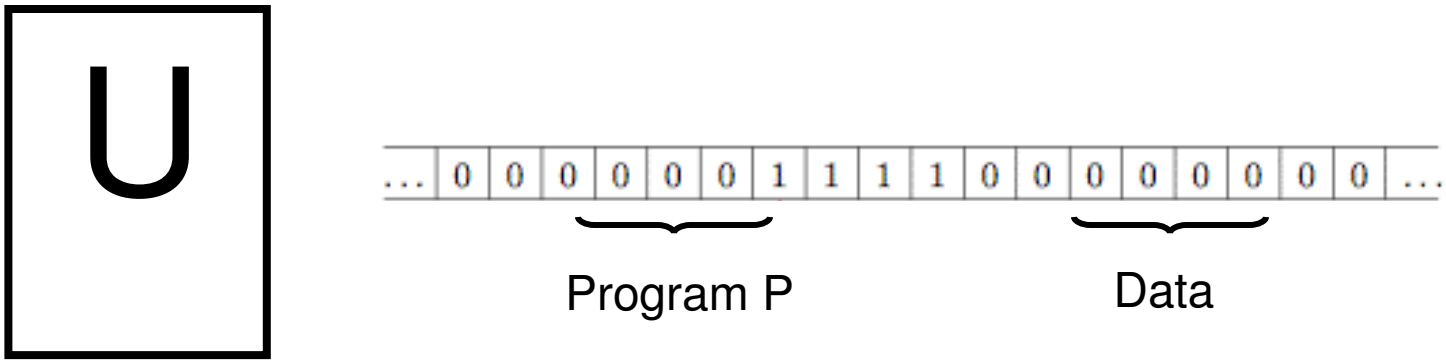


But can have -





Universal Program U

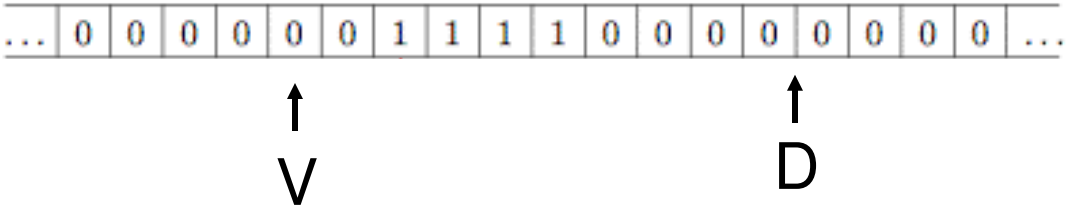


- U "simulates" what P would do on that data

(Sometimes also known as "interpreter")

Automated Bug Checking Revisited

Halting Problem



Let P = program such that code(P) = V.
Does P halt on data D?

IDEAS???

Trivial Idea: Simulate P using universal program U.
If P halts, will eventually detect.

Problem: But if P never halts, neither does the simulation.

Next Time: Halting Problem is unsolvable by another program

Read this proof in the Davis article, and try to understand.

Ponder the meaning of “Proof by contradiction.”
How convincing is such a proof?

“When something’s not right its wrong…” Bob Dylan

Turn in on Tues: A Turing-Post program that
prints the bit sequence 101 infinitely often,
as well as its binary code
