

Testing

The material for this lecture is drawn, in part, from The Practice of Programming (Kernighan & Pike) Chapter 6

1

Relevant Quotations

"On two occasions I have been asked [by members of Parliament!], 'Pray, Mr. Babbage, if you put into the machine wrong figures, will the right answers come out?' I am not able rightly to apprehend the kind of confusion of ideas that could provoke such a question."

- Charles Babbage

"Program testing can be quite effective for showing the presence of bugs, but is hopelessly inadequate for showing their absence."

- Edsger Dijkstra

"Beware of bugs in the above code; I have only proved it correct, not tried it."

- Donald Knuth

Goals of this Lecture

- · Help you learn about:
 - · Internal testing
 - External testing
 - · General testing strategies
- · Why?
 - · It's hard to know if a large program works properly
 - A power programmer expends at least as much effort writing test code as he/she expends writing the program itself
 - A power programmer knows many testing strategies

3

Program Verification

- Ideally: Prove that your program is correct
 - Can you **prove** properties of the program?
 - · Can you prove that it even terminates?!!!
 - See Turing's "Halting Problem"

Program Testing

 Pragmatically: Convince yourself that your program probably works

5

External vs. Internal Testing

- Types of testing
 - External testing
 - Designing data to test your program
 - Internal testing
 - · Designing your program to test itself

External Testing

- External Testing
 - · Designing data to test your program
 - 4 techniques...

7

Coverage Testing

(1) Statement testing

- "Testing to satisfy the criterion that each statement in a program be executed at least once during program testing."
 - Glossary of Computerized System and Software Development Terminology

(2) Path testing

- "Testing to satisfy coverage criteria that each logical path through the program be tested. Often paths through the program are grouped into a finite set of classes. One path from each class is then tested."
 - Glossary of Computerized System and Software Development Terminology
- More difficult than statement testing
 - · For simple programs, can enumerate all paths through the code
 - · Otherwise, sample paths through code with random input

Coverage Testing Example

Example pseudocode:

```
if (condition1)
    statement1;
else
    statement2;
...
if (condition2)
    statement3;
else
    statement4;
...
if (condition3)
    statement5;
else
    statement6;
...
```

Statement testing:

Should make sure all 3 "if" statements and all 6 nested statements are executed

Path testing:

Should make sure all logical paths are executed

Note: combinatorial!

9

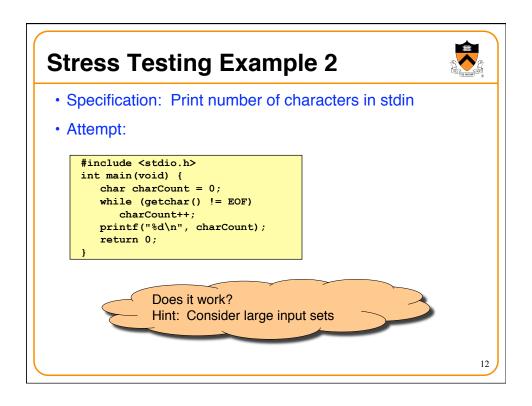

Brute Force: Stress Testing

(3) Stress testing

- "Testing conducted to evaluate a system or component at or beyond the limits of its specified requirements"
 - Glossary of Computerized System and Software Development Terminology
- · What to generate
 - Very large input sets
 - Random input sets (binary vs. ASCII)
- Use computer to generate input sets

Stress Testing Example 1 • Specification: Copy all characters of stdin to stdout • Attempt: #include <stdio.h> int main(void) { char c; while ((c = getchar()) != EOF) putchar(c); return 0; } Does it work? Hint: Consider random input sets

Apply Smarts: Boundary Testing

(4) Boundary testing

- "A testing technique using input values at, just below, and just above, the defined limits of an input domain; and with input values causing outputs to be at, just below, and just above, the defined limits of an output domain."
 - Glossary of Computerized System and Software Development Terminology
- Alias corner case testing

13

Boundary Testing Example

- Specification:
 - Read line from stdin, store as string in array (without '\n')
- First attempt:

```
int i;
char s[ARRAYSIZE];
for (i=0; ((i < ARRAYSIZE-1) && (s[i]=getchar()) != '\n'); i++)
   ;
s[i] = '\0';</pre>
```

- Consider boundary conditions:
 - 1. stdin contains no characters (empty file)
 - 2. stdin starts with '\n' (empty line)
 - 3. stdin contains characters but no \n'
 - 4. stdin line contains exactly ARRAYSIZE-1 characters
 - 5. stdin line contains exactly ARRAYSIZE characters
 - 6. stdin line contains more than ARRAYSIZE characters

Testing the First Attempt

• Embed code in complete program:

```
#include <stdio.h>
enum {ARRAYSIZE = 5}; /* Artificially small */
int main(void)
{
    int i;
    char s[ARRAYSIZE];
    for (i=0; ((i < ARRAYSIZE-1) && (s[i]=getchar()) != '\n'); i++)
        ;
    s[i] = '\0';
    for (i = 0; i < ARRAYSIZE; i++) {
        if (s[i] == '\0') break;
        putchar(s[i]);
    }
    return 0;
}</pre>
```

Test Results for First Attempt

```
int i;
char s[ARRAYSIZE];
for (i=0; ((i < ARRAYSIZE) && (s[i]=getchar()) != '\n')); i++)
;
s[i] = '\0';</pre>
```

- 1. stdin contains no characters (empty file)
 - → ÿÿÿÿÿ
 Fail
- 2. stdin starts with '\n' (empty line)
 - n → Pass
- 3. stdin contains characters but no \n'
 - ab → abÿÿÿ **Fail**

- 4. stdin line contains exactly ARRAYSIZE-1 characters
 - $abc_n \rightarrow abc$ Pass
- 5. stdin line contains exactly ARRAYSIZE characters
 - $abcd_n \rightarrow abcd$ Pass
- 6. stdin line contains more than ARRAYSIZE characters
 - abcde_n → abcd
 Pass or Fail????

Ambiguity in Specification

- If stdin line is too long, what should happen?
 - · Keep first ARRAYSIZE characters, discard the rest?
 - Keep first ARRAYSIZE -1 characters + \0' char, discard the rest?
 - Keep first ARRAYSIZE -1 characters + \0' char, save the rest for the next call to the input function?
- Probably, the specification didn't even say what to do if MAXLINE is exceeded
 - Probably the person specifying it would prefer that unlimited-length lines be handled without any special cases at all
 - Moral: testing has uncovered a design problem, maybe even a specification problem!
- Define what to do
 - Keep first ARRAYSIZE -1 characters + '\0' char, save the rest for the next call to the input function

- 1

Testing A Second Attempt

Embed code in complete program:

```
#include <stdio.h>
enum {ARRAYSIZE = 5}; /* Artificially small */
int main(void)
{
    int i;
    char s[ARRAYSIZE];
    for (i = 0; i < ARRAYSIZE; i++) {
        s[i] = getchar();
        if ((s[i] == EOF) || (s[i] == '\n'))
            break;
    }
    s[i] = '\0';
    for (i = 0; i < ARRAYSIZE; i++) {
        if (s[i] == '\0') break;
        putchar(s[i]);
    }
    return 0;
}</pre>
```

Test Results for Second Attempt

```
char s[ARRAYSIZE];
for (i = 0; i < ARRAYSIZE; i++) {
    s[i] = getchar();
    if ((s[i] == EOF) || (s[i] == '\n'))
        break;
}
s[i] = '\0';</pre>
```

Again:

Does it work?

- 1. stdin contains no characters (empty file)
 - → Pass
- 2. stdin starts with '\n' (empty line)
 - n → Pass
- 3. stdin contains characters but no '\n'
 - ab → ab Pass
- 4. stdin line contains exactly ARRAYSIZE-1 characters
 - $abc_n \rightarrow abc$ Pass
- 5. stdin line contains exactly ARRAYSIZE characters
 - $abcd_n \rightarrow abcd$ Pass
- 6. stdin line contains more than ARRAYSIZE characters
 - $abcde_n \rightarrow abcd$ Pass

19

Morals of this Little Story

- Testing can reveal the presence of bugs, but not their absence
- Complicated boundary cases often are symptomatic of bad design or bad specification
 - · Clean up the specification if you can
 - · Otherwise, fix the code

External Testing Summary

- External testing: Designing data to test your program
- External testing taxonomy
 - (1) Statement testing
 - (2) Path testing
 - (3) Stress testing
 - (4) Boundary testing

21

Internal Testing

- Internal testing
 - · Designing your program to test itself
 - 4 techniques...

Checking Invariants

(1) Checking invariants

- · Function should check aspects of data structures that shouldn't vary
- · Remember this for Assignment 6...
- Example: "doubly-linked list insertion" function
 - At leading and trailing edges
 - Traverse doubly-linked list; when node x points forward to node y, does node y point backward to node x?

What other invariants could be checked?

- Example: "balanced binary search tree insertion" function
 - · At leading and trailing edges
 - Traverse tree; are nodes still sorted?

What other invariants could be checked?

23

Checking Invariants (cont.)

Convenient to use assert to check invariants

```
int isValid(MyType object) {
    ...
    Check invariants here.
    Return 1 (TRUE) if object passes
    all tests, and 0 (FALSE) otherwise.
    ...
}

void myFunction(MyType object) {
    assert(isValid(object));
    ...
    Manipulate object here.
    ...
    assert(isValid(object));
}
```

Aside: The assert Macro

- The assert macro
 - · One actual parameter
 - Should evaluate to 0 (FALSE) or non-0 (TRUE)
 - If TRUE:
 - Do nothing
 - If FALSE:
 - Print message to stderr like "assert at line x failed"
 - · Exit the process
 - Note: this is for developers, not users do not expect to use for actual error reporting

25

Uses of assert

- Typical uses of assert
 - · Validate formal parameters

```
int gcd(int i, int j) {
    assert(i > 0);
    assert(j > 0);
    ...
}
```

Check for "impossible" logical flow

```
switch (state) {
   case START: ... break;
   case COMMENT: ... break;
   ...
   default: assert(0); /* Never should get here */
}
```

· Check invariants

Checking Return Values

(2) Checking function return values

- · In Java and C++:
 - · Method that detects error can "throw a checked exception"
 - Calling method must handle the exception (or rethrow it)
- In C:
 - · No exception-handling mechanism
 - · Function that detects error typically indicates so via return value
 - Programmer easily can forget to check return value
 - · Programmer (generally) should check return value

27

Checking Return Values (cont.)

(2) Checking function return values (cont.)

• Example: scanf() returns number of values read

```
Bad code
```

 Example: printf() can fail if writing to file and disk is full; returns number of characters (not values) written

Bad code???

```
int i = 100;
printf("%d", i);
```

```
int i = 100;
if (printf("%d", i) != 3)
    /* Error */
    Overkill?
```

Changing Code Temporarily

(3) Changing code temporarily

- Temporarily change code to generate artificial boundary or stress tests
- · Example: Array-based sorting program
 - · Temporarily make array very small
 - · Does the program handle overflow?
- Remember this for Assignment 3...
- Example: Program that uses a hash table
 - · Temporarily make hash function return a constant
 - All bindings map to one bucket, which becomes very large
 - · Does the program handle large buckets?

29

Leaving Testing Code Intact

(4) Leaving testing code intact

- Do not remove testing code when your code is finished
 - In industry, no code ever is "finished"
- · Leave tests in the code
- Maybe embed in calls of assert
 - Calls of assert can be disabled; described in precept

Internal Testing Summary

- · Internal testing: Designing your program to test itself
- Internal testing techniques
 - (1) Checking invariants
 - (2) Checking function return values
 - (3) Changing code temporarily
 - (4) Leaving testing code intact

Beware: Do you see a conflict between internal testing and code clarity?

31

General Testing Strategies

- General testing strategies
 - 5 strategies...

Automation

(1) Automation

- Create scripts and data files to test your programs
- Create software clients to test your modules
- Know what to expect
 - Generate output that is easy to recognize as right or wrong
- Automated testing can provide:
 - · Much better coverage than manual testing
 - · Bonus: Examples of typical use of your code

Have you used

in COS 217

programming

assignments?

these techniques

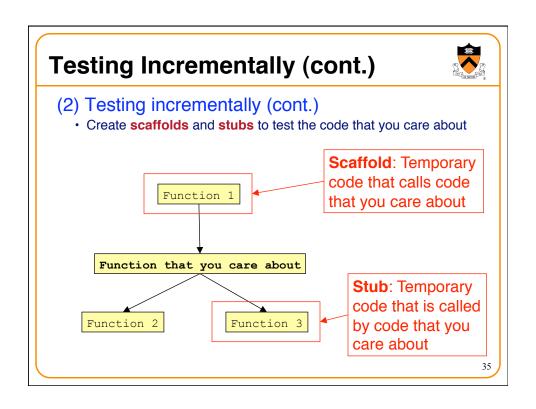

33

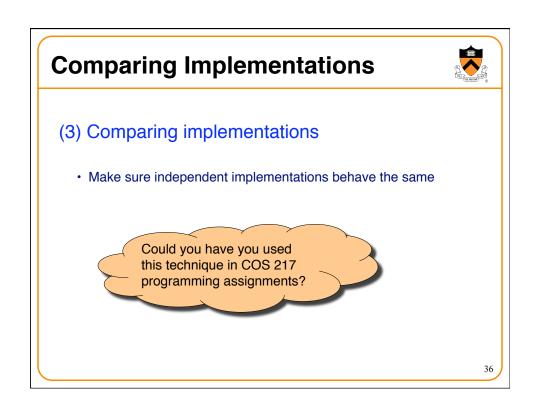

Testing Incrementally

(2) Testing incrementally

- · Test as you write code
 - · Add test cases as you create new code
 - · Test individual modules, and then their interaction
- Do regression testing
 - · After a bug fix, make sure program has not "regressed"
 - That is, make sure previously working code is not broken
 - · Rerun all test cases
 - · Note the value of automation

Bug-Driven Testing

(4) Bug-driven testing

- Find a bug \rightarrow create a test case that catches it
- · Facilitates regression testing

37

Fault Injection

(5) Fault injection

- Intentionally (temporarily) inject bugs
- · Determine if testing finds them
- · Test the testing

General Strategies Summary

- · General testing strategies
 - (1) Automation
 - (2) Testing incrementally
 - (3) Comparing implementations
 - (4) Bug-driven testing
 - (5) Fault injection

39

Who Tests What

- Programmers
 - White-box testing
 - · Pro: Programmer knows all data paths
 - · Con: Influenced by how code is designed/written
- Quality Assurance (QA) engineers
 - · Black-box testing
 - Pro: No knowledge about the implementation
 - · Con: Unlikely to test all logical paths
- Customers
 - Field testing
 - Pros: Unexpected ways of using the software; "debug" specs
 - Cons: Not enough cases; customers don't like "participating" in this process; malicious users exploit the bugs

Summary

- External testing taxonomy
 - · Statement testing
 - Path testing
 - · Stress testing
 - · Boundary testing
- Internal testing techniques
 - · Checking invariants
 - · Checking function return values
 - · Changing code temporarily
 - · Leaving testing code intact

41

Summary (cont.)

- General testing strategies
 - Automation
 - · Testing incrementally
 - · Regression testing
 - · Scaffolds and stubs
 - · Comparing independent implementations
 - · Bug-driven testing
 - · Fault injection
- Test the code, the tests and the specification!
