

## 3.2 Creating Data Types

### Data Types

**Data type.** Set of values and operations on those values.

**Basic types.**

Data Type	Set of Values	Some Operations
<b>boolean</b>	<b>true, false</b>	not, and, or, xor
<b>int</b>	$-2^{31}$ to $2^{31} - 1$	add, subtract, multiply
<b>String</b>	sequence of Unicode characters	concatenate, compare

**Last time.** Write programs that **use** data types.

**Today.** Write programs to **create** our own data types.

### Defining Data Types in Java

To define a data type, we must specify:

- Set of values.
- Operations defined on them.

**Java class.** Allows us to define data types by specifying:

- **Instance variables.** (set of values)
- **Methods.** (operations defined on them)
- **Constructors.** (create and initialize new objects)

## Point Charge Data Type

**Goal.** Create a data type to manipulate point charges.

**Set of values.** Three real numbers. [position and electrical charge]

**Operations.**

- Create a new point charge at  $(r_x, r_y)$  with electric charge  $q$ .
- Determine electric potential  $V$  at  $(x, y)$  due to point charge.
- Convert to `String`.

$$V = k \frac{q}{r}$$

$r$  = distance between  $(x, y)$  and  $(r_x, r_y)$

$k$  = electrostatic constant =  $8.99 \times 10^9 \text{ N} \cdot \text{m}^2 / \text{C}^2$

5

## Point Charge Data Type

**Goal.** Create a data type to manipulate point charges.

**Set of values.** Three real numbers. [position and electrical charge]

**API:**

```
public class Charge
```

```
    Charge(double x0, double y0, double q0)
```

```
    double potentialAt(double x, double y) electric potential at (x, y) due to charge
```

```
    String toString() string representation
```

6

## Charge Data Type: A Simple Client

**Client program.** Uses data type operations to calculate something.

```
public static void main(String[] args)
{
    double x = Double.parseDouble(args[0]);
    double y = Double.parseDouble(args[1]);
    Charge c1 = new Charge(.51, .63, 21.3);
    Charge c2 = new Charge(.13, .94, 81.9);
    double v1 = c1.potentialAt(x, y);
    double v2 = c2.potentialAt(x, y);
    StdOut.println(c1);
    StdOut.println(c2);
    StdOut.println(v1 + v2);
}
```

← automatically invokes  
the toString() method

```
% java Charge .50 .50
21.3 at (0.51, 0.63)
81.9 at (0.13, 0.94)
2.74936907085912e12
```

7

## Anatomy of Instance Variables

**Instance variables.** Specifies the set of values.

- Declare outside any method.
- Always use access modifier `private`.
- Use modifier `final` with instance variables that never change.

← makes data type abstract

← makes objects immutable (stay tuned)

```
public class Charge
{
    private final double rx, ry;
    private final double q;
    .
    .
    .
}
```

← instance variable declarations

← modifiers

8

## Anatomy of a Constructor

**Constructor.** Specifies what happens when you create a new object.

**Invoking a constructor.** Use `new` operator to create a new object.

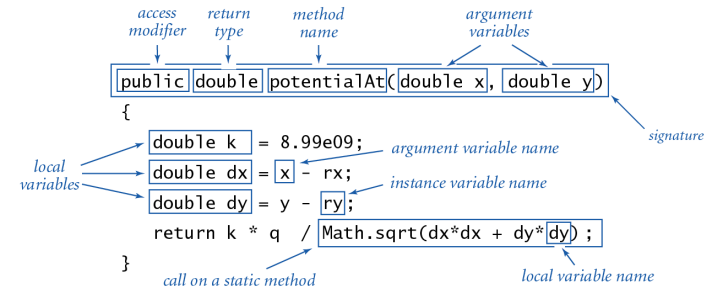

```
Charge c1 = new Charge(.51, .63, 21.3);
Charge c2 = new Charge(.13, .94, 81.9);
```

Annotations: `new` is labeled "invoke constructor".

9

## Anatomy of an Instance Method

**Method.** Define operations on instance variables.

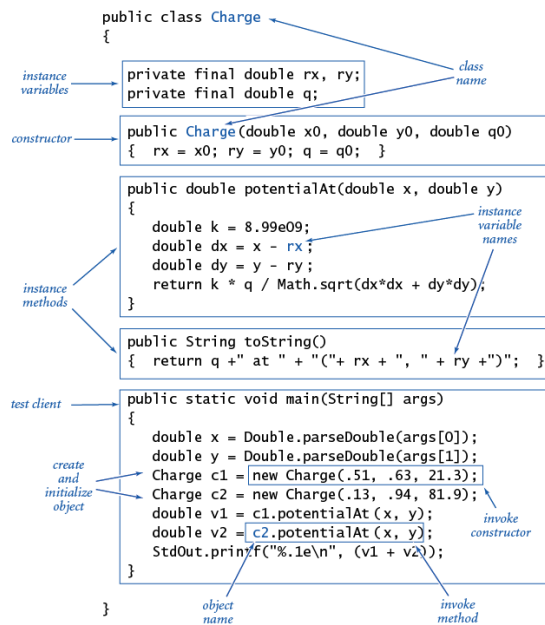

**Invoking a method.** Use dot operator to invoke a method in client code.

```
double v1 = c1.potentialAt(x, y);
double v2 = c2.potentialAt(x, y);
```

Annotations: `c1` is labeled "object name", `.potentialAt(x, y)` is labeled "invoke method".

10

## Anatomy of a Class

11

## Charge Client Example: Potential Visualization

**Potential visualization.** Read in N point charges from a file; compute total potential at each point in unit square. (And make a Picture.)

```
% more charges.txt
9
.51 .63 -100
.50 .50 40
.50 .72 10
.33 .33 5
.20 .20 -10
.70 .70 10
.82 .72 20
.85 .23 30
.90 .12 -50
```

```
% java Potential < charges.txt
```

12

## Potential Visualization

Arrays of objects. Allocate memory for the array; then allocate memory for each individual object.

```
// Read in the data.
int N = StdIn.readInt();
Charge[] a = new Charge[N];
for (int i = 0; i < N; i++)
{
    double x0 = StdIn.readDouble();
    double y0 = StdIn.readDouble();
    double q0 = StdIn.readDouble();
    a[i] = new Charge(x0, y0, q0);
}
```

13

## Potential Visualization

```
// Plot the data.
int SIZE = 512;
Picture pic = new Picture(SIZE, SIZE);
for (int col = 0; col < SIZE; col++)
    for (int row = 0; row < SIZE; row++)
    {
        double V = 0.0;
        for (int i = 0; i < N; i++)
        {
            double x = 1.0 * col / SIZE;
            double y = 1.0 * row / SIZE;
            V += a[i].potentialAt(x, y);
        }
        Color color = getColor(V); // Arbitrary double-Color map.
        pic.set(col, SIZE-1-row, color);
    }
pic.show();
```

$$V = \sum_i (k q_i / r_i)$$

(0, 0) is upper left

14

## Data Type Challenge

[easy if you read Exercise 3.2.5]

Fix the serious bug in the following code.

```
public class Charge
{
    private double rx, ry;
    private double q;
    public Charge (double x0, double y0, double q0)
    {
        double rx = x0;
        double ry = y0;
        double q = q0;
    }
}
```

15

## Turtle Graphics

## Turtle Graphics

**Goal.** Create a data type to manipulate a turtle moving in the plane.  
**Set of values.** Location and orientation of turtle.

**API.**

```
public class Turtle
{
    Turtle(double x0, double y0, double a0) create a new turtle at (x0, y0) facing a0 degrees counterclockwise from the x-axis
    void turnLeft(double delta) rotate delta degrees counterclockwise
    void goForward(double step) move distance step, drawing a line
}
```

```
// Draw a square.
Turtle turtle = new Turtle(0.0, 0.0, 0.0);
turtle.goForward(1.0);
turtle.turnLeft(90.0);
turtle.goForward(1.0);
turtle.turnLeft(90.0);
turtle.goForward(1.0);
turtle.turnLeft(90.0);
turtle.goForward(1.0);
turtle.turnLeft(90.0);
```

18

## Turtle Graphics Implementation

```
public class Turtle
{
    private double x, y; // turtle is at (x, y)
    private double angle; // facing this direction

    public Turtle(double x0, double y0, double a0)
    {
        x = x0;
        y = y0;
        angle = a0;
    }

    public void turnLeft(double delta)
    {
        angle += delta;
    }

    public void goForward(double d)
    {
        double oldx = x;
        double oldy = y;
        x += d * Math.cos(Math.toRadians(angle));
        y += d * Math.sin(Math.toRadians(angle));
        StdDraw.line(oldx, oldy, x, y);
    }
}
```

19

## Turtle client example: N-gon

```
public class Ngon
{
    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        double angle = 360.0 / N;
        double step = Math.sin(Math.toRadians(angle/2.0));
        Turtle turtle = new Turtle(0.5, 0, angle/2.0);
        for (int i = 0; i < N; i++)
        {
            turtle.goForward(step);
            turtle.turnLeft(angle);
        }
    }
}
```

3

7

20

## Turtle client example: Spira Mirabilis

```
public class Spira
{
    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        double decay = Double.parseDouble(args[1]);
        double angle = 360.0 / N;
        double step = Math.sin(Math.toRadians(angle/2.0));
        Turtle turtle = new Turtle(0.5, 0, angle/2.0);
        for (int i = 0; i < 10 * N; i++)
        {
            step /= decay;
            turtle.goForward(step);
            turtle.turnLeft(angle);
        }
    }
}
```

## Spira Mirabilis in Nature

22

## Complex Numbers

## Complex Number Data Type

**Goal.** Create a data type to manipulate complex numbers.

**Set of values.** Two real numbers: real and imaginary parts.

**API.**

```
public class Complex
{
    Complex(double real, double imag)
    Complex plus(Complex b)           sum of this number and b
    Complex times(Complex b)         product of this number and b
    double abs()                     magnitude
    String toString()                string representation
}
```

$$\begin{aligned} a &= 3 + 4i, \quad b = -2 + 3i \\ a + b &= 1 + 7i \\ a \times b &= -18 + i \\ |a| &= 5 \end{aligned}$$

25

## Applications of Complex Numbers

**Relevance.** A quintessential mathematical abstraction.

**Applications.**

- **Fractals.**
- Impedance in RLC circuits.
- Signal processing and Fourier analysis.
- Control theory and Laplace transforms.
- Quantum mechanics and Hilbert spaces.
- ...

26

## Complex Number Data Type: A Simple Client

**Client program.** Uses data type operations to calculate something.

```
public static void main(String[] args)
{
    Complex a = new Complex( 3.0, 4.0);
    Complex b = new Complex(-2.0, 3.0);
    Complex c = a.times(b);
    StdOut.println("a = " + a);
    StdOut.println("b = " + b);
    StdOut.println("c = " + c);
}
```

result of c.toString()

```
% java TestClient
a = 3.0 + 4.0i
b = -2.0 + 3.0i
c = -18.0 + 1.0i
```

**Remark.** Can't write  $a = b * c$  since no operator overloading in Java.

27

## Complex Number Data Type: Implementation

```
public class Complex
{
    private final double re;           instance variables
    private final double im;

    public Complex(double real, double imag)   constructor
    {
        re = real;
        im = imag;
    }

    public String toString()             methods
    { return re + " + " + im + "i"; }

    public double abs()
    { return Math.sqrt(re*re + im*im); }

    public Complex plus(Complex b)
    {
        double real = re + b.re;
        double imag = im + b.im;
        return new Complex(real, imag);
    }

    public Complex times(Complex b)
    {
        double real = re * b.re - im * b.im;
        double imag = re * b.im + im * b.re;
        return new Complex(real, imag);
    }
}
```

refers to b's instance variables

28

## Mandelbrot Set

**Mandelbrot set.** A particular set of complex numbers.

**Plot.** Plot  $(x, y)$  black if  $z = x + yi$  is in the set, and white otherwise.

Benoit Mandelbrot 1924-2010

- No simple formula describes which complex numbers are in set.
- Instead, describe using an **algorithm**.

29

## Mandelbrot Set

**Mandelbrot set.** Is complex number  $z_0$  in set?

- Iterate  $z_{t+1} = (z_t)^2 + z_0$ .
- If  $|z_t|$  diverges to infinity, then  $z_0$  not in set; otherwise  $z_0$  is in set.

t	$Z_t$
0	$-1/2 + 0i$
1	$-1/4 + 0i$
2	$-7/16 + 0i$
3	$-79/256 + 0i$
4	$-26527/65536 + 0i$
5	$-1443801919/4294967296 + 0i$

$z = -1/2 + 0i$  is in Mandelbrot set

t	$Z_t$
0	$1 + i$
1	$1 + 3i$
2	$-7 + 7i$
3	$1 - 97i$
4	$-9407 - 193i$
5	$88454401 + 3631103i$

$z = 1 + i$  is not in Mandelbrot set

30

## Plotting the Mandelbrot Set

### Practical issues.

- Cannot plot infinitely many points.
- Cannot iterate infinitely many times.

### Approximate solution.

- Sample from an  $N$ -by- $N$  grid of points in the plane.
- Fact: if  $|z_t| > 2$  for any  $t$ , then  $z$  not in Mandelbrot set.
- Pseudo-fact: if  $|z_{255}| \leq 2$  then  $z$  "likely" in Mandelbrot set.

31

## Complex Number Data Type: Another Client

### Mandelbrot function with complex numbers.

- Is  $z$  in the Mandelbrot set?
- Returns white (definitely no) or black (probably yes).

```
public static Color mand(Complex z0)
{
    Complex z = z0;
    for (int t = 0; t < 255; t++)
    {
        if (z.abs() > 2.0) return Color.WHITE;
        z = z.times(z);
        z = z.plus(z0);
    }
    return Color.BLACK;
}
```

$z = z^2 + z_0$

More dramatic picture: replace `Color.WHITE` with grayscale or color.

```
new Color(255-t, 255-t, 255-t)
```

32

## Complex Number Data Type: Another Client

### Plot the Mandelbrot set in gray scale.

```
public static void main(String[] args)
{
    double xc = Double.parseDouble(args[0]);
    double yc = Double.parseDouble(args[1]);
    double size = Double.parseDouble(args[2]);
    int N = 512;
    Picture pic = new Picture(N, N);

    for (int x = 0; x < N; x++)
        for (int y = 0; y < N; y++)
        {
            double x0 = xc - size/2 + size*x/N;
            double y0 = yc - size/2 + size*y/N;
            Complex z0 = new Complex(x0, y0);
            Color color = mand(z0);
            pic.set(x, N-1-y, color);
        }
    pic.show();
}
```

← scale to screen coordinates

← (0, 0) is upper left

33

## Mandelbrot Set

```
% java Mandelbrot -.5 0 2
```

```
% java Mandelbrot .1045 -.637 .01
```

34

# Mandelbrot Set

```
java ColorMandelbrot -1.5 0 2 < mandel.txt
```

-1.5 0 .02

-1.5 0 .002

35
