Program and Programming Style

The material for this lecture is drawn, in part, from *The Practice of Programming* (Kernighan & Pike) Chapter 1
Any fool can write code that a computer can understand. Good programmers write code that humans can understand.

-- Martin Fowler

Good code is its own best documentation. As you're about to add a comment, ask yourself, "How can I improve the code so that this comment isn't needed?"

-- Steve McConnell

Programs must be written for people to read, and only incidentally for machines to execute.

-- Abelson / Sussman
Goals of this Lecture

Help you learn about:

• Good program style
• Good programming style

Why?

• A well-styled program is more likely to be correct than a poorly-styled program
• A well-styled program is more likely to stay correct (i.e. is more maintainable) than a poorly-styled program
• A power programmer knows the qualities of a well-styled program, and how to compose one quickly
Agenda

Program style
• Qualities of a good program

Programming style
• How to write a good program quickly
Motivation for Program Style

Who reads your code?

- The compiler
- Other programmers

typedef struct{double x,y,z}vec; vec U,black,amb={.02,.02,.02}; struct sphere{ vec cen, color; double rad, kd, ks, kt, kl, ir } *s, *best, sph[]={0.,6.,5.,1.,1.,1.,9., .05.,2.,85.,0.,1.7,,-1.,8.,-5.,1.,5.,2.,1.,7.,3.0.,.05,1.2,1.,8.,-5.,1.,8.,8., 1.,3.,7.,0.,0.,1.2,3.,-6.,15.,1.,8.,1.,7.,0.,0.,0.,0.,6,1.5,,-3.,-3.,12.,8,1., 1.,5.,0.,0.,0.,5,1.5,}; yx; double u,b,tmin,sqrt(),tan(); double vdot(A,B) vec A ,B; {return A.x*B.x+A.y*B.y+A.z*B.z;} vec vcomb(a,A,B) double a; vec A,B; {B.x+=a* A.x;B.y+=a*A.y;B.z+=a*A.z;return B;} vec vunit(A) vec A; {return vcomb(1./sqrt( vdot(A,A)),A,black);} struct sphere*intersect(P,D) vec P,D; {best=0; tmin=1e30; s= sph+5; while(s--sph)b=vdot(D,U=vcomb(-1.,P,s-cen)),u=b*b-vdot(U,U)+s-rad*s - rad,u=u0?sqrt(u):1e31,u=b-vdot(U,U)+s-rad*s - rad,u=u0?sqrt(u):1e31,u=b-u1e-7?b-u:b+u,tmin=1e-7&&u<tmin?best=s,u: tmin; return best;} vec trace(level,P,D) vec P,D; {double d, eta, e; vec N, color; struct sphere*s,*l; if(!level--)return black;if(s=intersect(P,D));else return amb; color=amb; eta=s-ir; d= -vdot(D,N=vunit(vcomb(-1.,P=vcomb(tmin,D,P),s-cen)))) ;if(d<0)N=vcomb(-1.,N,black), eta=1/eta,d= -d; e=sph+5; while(1--sph)if((e=1 - kl*vdot(N,U=vunit(vcomb(-1.,P,cen))))0&isintersect(P,U)==1)color=vcomb(e ,1-color,color);U=s-color;color.x*=U.x;color.y*=U.y;color.z*=U.z;e=1-eta* e*(1- d*d); return vcomb(s-kt,e0?trace(level,P,vcomb(eta,D,vcomb(eta*d-sqrt (e),N,black))) :black,vcomb(s-ks,trace(level,P,vcomb(2*dt,D),vcomb(s-ks, color,vcomb(s-kl,U,black)))))); }main(){printf("%d \%d \n",32,32);while((yx<32*32) U.x=yx%32-32/2,U.z=32/2-yx++/32,U.y=32/2/tan(25/114.5915590261),U=vcomb(255., trace(3,black,vunit(U)),black),printf("%.0f %.0f %.0f \n",U);}
Motivation for Program Style

Why does program style matter?
  • Correctness
    • The clearer a program is, the more likely it is to be correct
  • Maintainability
    • The clearer a program is, the more likely it is to stay correct over time

Good program ≈ clear program
Choosing Names

Use descriptive names for globals and functions
  • E.g., display, CONTROL, CAPACITY

Use concise names for local variables
  • E.g., i (not arrayIndex) for loop variable

Use case judiciously
  • E.g., Stack_push (Module_function)
    CAPACITY (constant)
    buf (local variable)

Use a consistent style for compound names
  • E.g., frontsize, frontSize, front_size

Use active names for functions that do something
  • E.g., getchar(), putchar(), Check_octal(), etc.

Not necessarily for functions that are something: sin(), sqrt()
Using C Idioms

Use C idioms

- Example: Set each array element to 1.0.
- Bad code (complex for no obvious gain)

```
i = 0;
while (i <= n-1)
    array[i++] = 1.0;
```

- Good code (not because it’s vastly simpler—it isn’t!—but because it uses a standard idiom that programmers can grasp at a glance)

```
for (i = 0; i < n; i++)
    array[i] = 1.0;
```

- Don’t feel obliged to use C idioms that decrease clarity
Parenthesize for correctness and to resolve ambiguity

- Example: read and print character until end-of-file

- Broken code

```c
while (c = getchar() != EOF)  
  putchar(c);
```

- Working, idiomatic code

```c
while ((c = getchar()) != EOF)  
  putchar(c);
```
Q: Does the following code work to check if integer $n$ satisfies $j < n < k$?

```java
if (j < n && n < k)
```

A. No, needs to be `if (((j < n) && (n < k))`  
B. Correct, but I'd parenthesize anyway  
C. Correct, and I'd leave it alone
Revealing Structure: Expressions

Parenthesize for correctness and to resolve ambiguity

• Example: Check if integer $n$ satisfies $j < n < k$

• Common code

```c
if (j < n && n < k)
```

• Clearer code (maybe)

```c
if (((j < n) && (n < k))
```

It’s clearer depending on whether your audience can be trusted to know the precedence of all the C operators. Use your judgment on this!
Q: Does the following code work to check if integer $n$ satisfies $j < n < k$?

```java
if (!((n >= k) || (n <= j)))
```

A. No, incorrect

B. Not sure – I can't be expected to apply DeMorgan's laws during a 10 AM lecture

C. Correct, but I'd never write such a monstrosity
Use natural form of expressions

- Example: Check if integer $n$ satisfies $j < n < k$
- Bad code

```
if (!((n >= k) || (n <= j)))
```

- Good code

```
if ((j < n) && (n < k))
```

- Conditions should read as you’d say them aloud
  - Not “Conditions shouldn’t read as you’d never say them in other than a purely internal dialog!”
Revealing Structure: Expressions

Break up complex expressions

- Example: Identify chars corresponding to months of year
- Bad code

```java
if ((c == 'J') || (c == 'F') || (c == 'M') || (c == 'A') || (c == 'S') || (c == 'O') || (c == 'N') || (c == 'D'))
```

- Good code – lining up things helps

```java
if ((c == 'J') || (c == 'F') || (c == 'M') || (c == 'A') || (c == 'S') || (c == 'O') || (c == 'N') || (c == 'D'))
```

- Very common, though, to elide parentheses

```java
if (c == 'J' || c == 'F' || c == 'M' || c == 'A' || c == 'S' || c == 'O' || c == 'N' || c == 'D')
```
Revealing Structure

Perhaps better in this case: a switch statement

```c
if (c == 'J' || c == 'F' || c == 'M' || c == 'A' || c == 'S' || c == 'O' || c == 'N' || c == 'D')
do_this();
else
do_that();
```

```c
switch (c) {
    case 'J': case 'F': case 'M':
    case 'A': case 'S': case 'O':
    case 'N': case 'D':
        do_this();
        break;
    default:
        do_that();
}
```
Revealing Structure: Spacing

Use readable/consistent spacing

- Example: Assign each array element $a[j]$ to the value $j$.
- Bad code

```c
for (j=0; j<100; j++) a[j]=j;
```

- Good code

```c
for (j = 0; j < 100; j++)
    a[j] = j;
```

- Often can rely on auto-indenting feature in editor
Use readable/consistent/correct indentation

- Example: Checking for leap year (does Feb 29 exist?)

```plaintext
legal = TRUE;
if (month == FEB)
    {  if (((year % 4) == 0)
        if (day > 29)
            legal = FALSE;
        else
            if (day > 28)
                legal = FALSE;
        }

Does this code work?

legal = TRUE;
if (month == FEB)
    {  if (((year % 4) == 0)
        {  if (day > 29)
            legal = FALSE;
        }
    }
    else
        {  if (day > 28)
            legal = FALSE;
        }

Does this code work?
```
Revealing Structure: Indentation

Use “else-if” for multi-way decision structures
• Example: Comparison step in a binary search.

• Bad code

```java
if (x < a[mid])
    high = mid - 1;
else
    if (x > a[mid])
        low = mid + 1;
    else
        return mid;
```

• Good code

```java
if (x < a[mid])
    high = mid - 1;
else if (x > a[mid])
    low = mid + 1;
else
    return mid;
```
Use blank lines to divide the code into key parts

```c
#include <stdio.h>
#include <stdlib.h>

/* Read a circle's radius from stdin, and compute and write its
diameter and circumference to stdout. Return 0 if successful. */

int main(void)
{
    const double PI = 3.14159;
    int radius;
    int diam;
    double circum;

    printf("Enter the circle's radius:
");
    if (scanf("%d", &radius) != 1)
    {   fprintf(stderr, "Error: Not a number\n");
        exit(EXIT_FAILURE); /* or: return EXIT_FAILURE; */
    }
    ...
```
Use blank lines to divide the code into key parts

diam = 2 * radius;
circum = PI * (double)diam;

printf("A circle with radius %d has diameter %d\n", radius, diam);
printf("and circumference %f.\n", circum);

return 0;
}
Composing Comments

Master the language and its idioms
  • Let the code speak for itself
  • And then…

Compose comments that add new information
  i++; /* Add one to i. */

Comment paragraphs of code, not lines of code
  • E.g., “Sort array in ascending order”

Comment global data
  • Global variables, structure type definitions, field definitions, etc.

Compose comments that agree with the code!!!
  • And change as the code itself changes!!!
Composing Comments

Comment sections ("paragraphs") of code, not lines of code

```c
#include <stdio.h>
#include <stdlib.h>

/* Read a circle's radius from stdin, and compute and write its
diameter and circumference to stdout. Return 0 if successful. */

int main(void)
{  const double PI = 3.14159;
   int radius;
   int diam;
   double circum;

   /* Read the circle's radius. */
   printf("Enter the circle's radius:\n");
   if (scanf("%d", &radius) != 1)
   {  fprintf(stderr, "Error: Not a number\n");
      exit(EXIT_FAILURE);  /* or:  return EXIT_FAILURE; */
   }
...
```
Composing Comments

/* Compute the diameter and circumference. */
diam = 2 * radius;
circum = PI * (double)diam;

/* Print the results. */
printf("A circle with radius %d has diameter %d\n", 
    radius, diam);
printf("and circumference %f.\n", circum);

return 0;
}
Composing Function Comments

Describe **what a caller needs to know** to call the function properly
- Describe **what the function does**, not **how it works**
- Code itself should clearly reveal how it works…
- If not, compose “paragraph” comments within definition

Describe **input**
- Parameters, files read, global variables used

Describe **output**
- Return value, parameters, files written, global variables affected

Refer to parameters **by name**
Bad function comment

/* decomment.c */

/* Read a character. Based upon the character and the current DFA state, call the appropriate state-handling function. Repeat until end-of-file. */

int main(void)
{
    ...
}

Describes **how the function works**
Composing Function Comments

Good function comment

/* decomment.c */

/* Read a C program from stdin. Write it to stdout with each comment replaced by a single space. Preserve line numbers. Return 0 if successful, EXIT_FAILURE if not. */

int main(void)
{
    ...
}

• Describes what the function does
Using Modularity

Abstraction is the key to managing complexity
- Abstraction is a tool (the only one?) that people use to understand complex systems
- Abstraction allows people to know what a (sub)system does without knowing how

Proper modularity is the manifestation of abstraction
- Proper modularity makes a program's abstractions explicit
- Proper modularity can dramatically increase clarity
  ⇒ Programs should be modular

However
- Excessive modularity can decrease clarity!
- Improper modularity can dramatically decrease clarity!!!
  ⇒ Programming is an art
Modularity Examples

Examples of **function**-level modularity
- Character I/O functions such as `getchar()` and `putchar()`
- Mathematical functions such as `sin()` and `gcd()`
- Function to sort an array of integers

Examples of **file**-level modularity
- Assignment 3.
- And all the other assignments.
Good program ≈ clear program

Qualities of a clear program

- Uses appropriate names
- Uses common idioms
- Reveals program structure
- Contains proper comments
- Is modular
Agenda

**Program style**
- Qualities of a good program

**Programming style**
- How to write a good program quickly
Bottom-Up Design

Bottom-up design 😞

• Design one part of the system in detail
• Design another part of the system in detail
• Combine
• Repeat until finished

Bottom-up design in painting

• Paint part of painting in complete detail
• Paint another part of painting in complete detail
• Combine
• Repeat until finished
• *Unlikely to produce a good painting*
  
  *(except sometimes: see the movie “Tim’s Vermeer”)*
Bottom-Up Design

Bottom-up design in **programming**

- Compose part of program in complete detail
- Compose another part of program in complete detail
- Combine
- Repeat until finished
- *Unlikely to produce a good program*

```
... 5
  3  4
  1  2 ...
```

```
1
2
3
4
5
...```
Top-Down Design

Top-down design 😊

• Design entire product with minimal detail
• Successively refine until finished

Top-down design in painting

• Sketch the entire painting with minimal detail
• Successively refine until finished
Top-Down Design

Top-down design in **programming**
- Define main() function in pseudocode with minimal detail
- Refine each pseudocode statement
  - Small job ⇒ replace with real code
  - Large job ⇒ replace with function call
- Repeat in (mostly) breadth-first order until finished

- Bonus: Product is naturally **modular**
Top-down design in programming in reality

- Define main() function in pseudocode
- Refine each pseudocode statement
  - Oops! Details reveal design error, so…
  - Backtrack to refine existing (pseudo)code, and proceed
- Repeat in (mostly) breadth-first order until finished
Aside: Least-Risk Design

Design process should minimize risk

Bottom-up design
- Compose each child module before its parent
- **Risk level**: high
  - May compose modules that are never used

Top-down design
- Compose each parent module before its children
- **Risk level**: low
  - Compose only those modules that are required
Aside: Least-Risk Design

Recommendation

- Work mostly top-down
- But give high priority to risky modules (that may result in major rewrites)
- Create scaffolds and stubs as required
Example: Text Formatting

Functionality (derived from King Section 15.3)

• **Input:** ASCII text, with arbitrary spaces and newlines
• **Output:** the same text, left and right justified
  • Fit as many words as possible on each 50-character line
  • Add even spacing between words to right justify the text
  • No need to right justify last line
• **Assumptions**
  • “Word” is a sequence of non-white-space chars followed by a white-space char or end-of-file
  • No word is longer than 20 chars
"C is quirky, flawed, and an enormous success. While accidents of history surely helped, it evidently satisfied a need for a system implementation language efficient enough to displace assembly language, yet sufficiently abstract and fluent to describe algorithms and interactions in a wide variety of environments." -- Dennis Ritchie
Caveats concerning the following presentation

- Function comments and some blank lines are omitted
  - Because of space constraints
  - Don’t do that!!!
- Design sequence is idealized
  - In reality, typically much backtracking would occur
The main() Function

int main(void)
{
    <clear line>
    <read a word>
    while (<there is a word>)
    {
        if (<word doesn’t fit on line>)
        {
            <write justified line>
            <clear line>
        }
        <add word to line>
        <read a word>
    }
    if (<line isn’t empty>)
    {
        <write line>
        return 0;
    }
}
enum {MAX_WORD_LEN = 20};
int main(void)
{
    char word[MAX_WORD_LEN+1];
    int wordLen;
    <clear line>
    wordLen = readWord(word);
    while (<there is a word>)
    {
        if (<word doesn’t fit on line>)
        {
            <write justified line>
            <clear line>
        }
        <add word to line>
        wordLen = readWord(word);
    }
    if (<line isn’t empty>)
    {
        <write line>
        return 0;
    }
}
enum {MAX_WORD_LEN = 20};
int main(void)
{
    char word[MAX_WORD_LEN+1];
    int wordLen;
    wordLen = readWord(word);
    while (wordLen != 0)
    {
        if (<word doesn’t fit on line>)
        {
            <write justified line>
            <clear line>
        }
        <add word to line>
        wordLen = readWord(word);
    }
    if (<line isn’t empty>)
    {
        <write line>
        return 0;
    }
}
enum {MAX_WORD_LEN = 20};
int main(void)
{
    char word[MAX_WORD_LEN+1];
    int wordLen;
    int lineLen;
    
    wordLen = readWord(word);
    while (wordLen != 0)
    {
        if (<word doesn’t fit on line>)
        {
            <write justified line>
            <clear line>
        }
        <add word to line>   
        wordLen = readWord(word);
    }
    if (lineLen > 0)
    {
        <write line>
        return 0;
    }
The main() Function

```c
enum {MAX_WORD_LEN = 20};
enum {MAX_LINE_LEN = 50};
int main(void)
{
    char word[MAX_WORD_LEN+1];
    char line[MAX_LINE_LEN+1];
    int wordLen;
    int lineLen;
    wordLen = readWord(word);
    while (wordLen != 0)
    {
        if (<word doesn't fit on line>)
        {
            <write justified line>
            <clear line>
        }
        lineLen = addWord(word, line, lineLen);
        wordLen = readWord(word);
    }
    if (lineLen > 0)
    {
        <write line>
        return 0;
    }
}
enum {MAX_WORD_LEN = 20};
enum {MAX_LINE_LEN = 50};
int main(void)
{
  char word[MAX_WORD_LEN+1];
  char line[MAX_LINE_LEN+1];
  int wordLen;
  int lineLen;
  <clear line>
  wordLen = readWord(word);
  while (wordLen != 0)
  {
    if (<word doesn’t fit on line>)
    {
      <write justified line>
    }
    lineLen = addWord(word, line, lineLen);
    wordLen = readWord(word);
  }
  if (lineLen > 0)
    puts(line);
  return 0;
}
The main() Function

```c
enum {MAX_WORD_LEN = 20};
enum {MAX_LINE_LEN = 50};
int main(void)
{
    char word[MAX_WORD_LEN+1];
    char line[MAX_LINE_LEN+1];
    int wordLen;
    int lineLen = 0;
    int wordCount = 0;
    <clear line>
    wordLen = readWord(word);
    while (wordLen != 0)
    {
        if (<word doesn’t fit on line>)
        {
            writeLine(line, lineLen, wordCount);
            <clear line>
        }
        lineLen = addWord(word, line, lineLen);
        wordLen = readWord(word);
    }
    if (lineLen > 0)
    {
        puts(line);
    }
    return 0;
}
```
The main() Function

```c
enum {MAX_WORD_LEN = 20};
enum {MAX_LINE_LEN = 50};
int main(void)
{
    char word[MAX_WORD_LEN+1];
    char line[MAX_LINE_LEN+1];
    int wordLen;
    int lineLen = 0;
    int wordCount = 0;
    wordLen = readWord(word);
    while (wordLen != 0)
    {
        if ((wordLen + 1 + lineLen) > MAX_LINE_LEN)
        {
            writeLine(line, lineLen, wordCount);
            lineLen = addWord(word, line, lineLen);
        }
        lineLen = addWord(word, line, lineLen);
        wordLen = readWord(word);
    }
    if (lineLen > 0)
        puts(line);
    return 0;
}
```
enum {MAX_WORD_LEN = 20};
enum {MAX_LINE_LEN = 50};
int main(void)
{
    char word[MAX_WORD_LEN+1];
    char line[MAX_LINE_LEN+1];
    int wordLen;
    int lineLen = 0;
    int wordCount = 0;
    line[0] = '\0'; lineLen = 0; wordCount = 0;
    wordLen = readWord(word);
    while (wordLen != 0)
    {
        if ((wordLen + 1 + lineLen) > MAX_LINE_LEN)
        {
            writeLine(line, lineLen, wordCount);
            line[0] = '\0'; lineLen = 0; wordCount = 0;
        }
        lineLen = addWord(word, line, lineLen);
        wordLen = readWord(word);
    }
    if (lineLen > 0)
        puts(line);
    return 0;
}
Status

main

readWord

writeLine

addWord
int readWord(char *word)
{
    <skip over white space>

    <read chars, storing up to MAX_WORD_LEN in word>

    <return length of word>
}
The readWord() Function

```c
int readWord(char *word)
{
    int ch;

    /* Skip over white space. */
    ch = getchar();
    while ((ch != EOF) && isspace(ch))
        ch = getchar();

    /* Read up to MAX_WORD_LEN chars into word */
    <read up to MAX_WORD_LEN chars into word>

    <return length of word>
}
```

Note the use of a function from the standard library. Very appropriate for your top-down design to target things that are already built.
int readWord(char *word) {
    int ch;
    int pos = 0;

    /* Skip over white space. */
    ch = getchar();
    while ((ch != EOF) && isspace(ch))
        ch = getchar();

    /* Read up to MAX_WORD_LEN chars into word. */
    while ((ch != EOF) && (! isspace(ch)))
    {  
        if (pos < MAX_WORD_LEN)
        {  
            word[pos] = (char)ch;
            pos++;
        }
        ch = getchar();
    }

    word[pos] = '\0';

    <return length of word>
}
The readWord() Function

```c
int readWord(char *word)
{
    int ch;
    int pos = 0;
    ch = getchar();

    /* Skip over white space. */
    while ((ch != EOF) && isspace(ch))
        ch = getchar();

    /* Read up to MAX_WORD_LEN chars into word. */
    while ((ch != EOF) && (! isspace(ch)))
    {
        if (pos < MAX_WORD_LEN)
            { word[pos] = (char)ch;
                pos++;
            }
        ch = getchar();
    }
    word[pos] = '\0';

    return pos;
}
```

readWord() gets away with murder here, consuming/discarding one character past the end of the word.

Complete! And modular!
Summary

Program style
• Choose appropriate names (for variables, functions, …)
• Use common idioms (but not at the expense of clarity)
• Reveal program structure (spacing, indentation, parentheses, …)
• Compose proper comments (especially for functions)
• Use modularity (because modularity reveals abstractions)

Programming style
• Use top-down design and successive refinement
• But know that backtracking inevitably will occur
• And give high priority to risky modules
Are we there yet?

Now that the top-down design is done, and the program “works,” does that mean we’re done?

No. There are almost always things to improve, perhaps by a bottom-up pass that better uses existing libraries.

The second time you write the same program, it turns out better.
"C is quirky, flawed, and an enormous success. While accidents of history surely helped, it evidently satisfied a need for a system implementation language efficient enough to displace assembly language, yet sufficiently abstract and fluent to describe algorithms and interactions in a wide variety of environments." -- Dennis Ritchie
"C is quirky, flawed, and an enormous success. While accidents of history surely helped, it evidently satisfied a need for a system implementation language efficient enough to displace assembly language, yet sufficiently abstract and fluent to describe algorithms and interactions in a wide variety of environments."
-- Dennis Ritchie
Challenge problem

Design a function    int spacesHere(int i, int k, int n)

that calculates how many marbles to put into the $i$th jar, assuming that there are $n$ marbles to distribute over $k$ jars.

(1) the jars should add up to $n$, that is,

\{s=0; for(i=0;i<k;i++) s+=spacesHere(i,k,n); assert (s==n);\}

or in math notation, $\sum_{i=0}^{k-1} \text{spacesHere}(i,k,n) = n$

(2) marbles should be distributed evenly—the "extra" marbles should not bunch up in nearby jars.

HINT: You should be able to write this in one or two lines, without any loops.

One solution uses floating-point division and rounding; do "man round" and pay attention to where that man page says "include <math.h>".
