Princeton University
COS 217: Introduction to Programming Systems
Spring 2019 Final Exam Preparation

The exam is a three-hour, closed-book, closed-notes, closed-handouts exam. The exam is cumulative, but emphasizes second-half material. During the exam you may not use a "cheat-sheet." During the exam you may not use computers, calculators, or other electronic devices.

Topics

*You are responsible for all material covered in lectures, precepts, assignments, and required readings. This is a non-exhaustive list of topics that were covered. Topics that were not covered on the midterm exam are in **boldface**.*

1. Number Systems

    Binary, octal, and hexadecimal
    Finite unsigned integers, operations, and overflow
    Finite two's complement signed integers, operations, and overflow
    Floating-point numbers

2. C Programming

    From source to executable: preprocess, compile, assemble, link
    Program structure: multi-file programs with header files
    Process memory layout: text, stack, heap, rodata, **data**, **bss** sections
    Primitive data types
    Variable declarations and definitions
    Variable scope, **linkage, and duration/extent**
    Constants: `#define`, constant variables, enumerations
    Operators
    Statements
    Function declarations and definitions
    Pointers and arrays
        Call-by-reference, arrays as parameters, strings
        Command-line arguments
    Input/output facilities for standard streams **and files**, and for text **and binary data**
        `getchar()`, `fgetc()`, `putchar()`, `fputc()`, `gets()`, `fgets()`, `puts()`, `fputs()`, `scanf()`, `fscanf()`, `printf()`, `fprintf()`, **`fopen()`**, **`fclose()`**, **`fwrite()`**, **`putc()`**
    Structures
    Dynamic memory management
        `malloc()`, `calloc()`, `realloc()`, `free()`
        Common errors: dereference of dangling pointer, memory leak, double free
    Abstract objects
    Abstract data types; opaque pointers
    Generic data structures and functions
        Void pointers
        Function pointers and function callbacks
    Parameterized macros and their dangers (see King Section 14.3)

3. Programming-in-the-Large

Modules and interfaces
Abstract data types and ADT design in C
Heuristics for effective modules: encapsulates data, manages resources, is consistent, has a minimal interface, detects and handles/reports errors, establishes contracts, has strong cohesion, has weak coupling
Program and programming style
Bottom-up design, top-down design, least-risk design
Building
Motivation for `make`, `make` fundamentals, non-file targets, macros
Testing
External testing with scripts
Internal testing with assertions: validating parameters and return values, checking invariants, checking array subscripts, checking function values
Unit testing with scaffolds and stubs
Test coverage: statement, path, boundary
Debugging
General heuristics for debugging: understand error messages, think before writing, look for familiar bugs, divide and conquer, add more internal tests, display output, use a debugger, focus on recent changes
Heuristics for debugging dynamic memory management: look for common DMM bugs, diagnose seg faults using gdb, manually inspect `malloc()` calls, comment-out `free()` calls, use Meminfo, use Valgrind

Performance improvement
Should you optimize?
Performance improvement pros and cons, do timing studies
What should you optimize?
Use a performance profiler
Optimization techniques
Use a better algorithm or data structure, avoid repeated computation, inline function calls, unroll loops, use a lower-level language

4. Under the Hood: Language Levels Tour

Language levels
High-level vs. assembly vs. machine language
Computer architecture
The Von Neumann architecture
RAM
CPU: control unit, ALU, registers
Big-endian vs. little-endian byte order
CISC vs. RISC architectures
ARMv8 computer architecture
General purpose registers: R0-R30
8-byte: X0-X30
4-byte: W0-W30
Special purpose registers: ZR, XZR, WZR; SP, WSP; PSTATE
ARMv8 assembly language
Label definitions
Directives
Instructions
Load instructions
Store instructions
Manipulation instructions

- **Data copy, address generation, arithmetic, logical, shift, branch, function call/return**
- **Control flow**
  - **Unconditional branches**
  - **Conditional branches**
    - **Condition flags (N, C, Z, and V) in PSTATE register**
      - **Set by cmp instruction (and other instructions)**
      - **Examined by conditional branch instructions**
    - **Conditional branches with signed data**
      - **`beq`, `bne`, `blt`, `ble`, `bgt`, `bge`**
    - **Conditional branches with unsigned data**
      - **`beq`, `bne`, `blo`, `bls`, `bhi`, `bhs`**
  - **Memory operands**
    - **Register, immediate offset, register offset, scaled register offset**
  - **Data structures**
    - **Arrays**
    - **Structures**
      - **Padding**
  - **Local variables**
    - **The stack section and the SP register**
  - **ARMv8 function call conventions**
    - **Calling and returning**
      - **The `bl` instruction, the `ret` instructions, the X30 register**
    - **Passing arguments**
      - **Registers: R0-R7**
    - **Returning a value**
      - **Register: R0**
    - **Optimization**
      - **Caller-saved registers: R0-R7, R9-R15**
        - **Used for parameters and scratch**
        - **Caller must save, if it wants**
      - **Callee-saved registers: R19-R28**
        - **Used for local variables**
        - **Callee must save**
- **ARMv8 machine language**
  - **ARMv8 instruction format**
  - **Machine language after assembly**
    - **DATA section, RODATA section, BSS section, TEXT section, relocation records**
  - **Machine language after linking**
    - **Resolution: fetch library code**
    - **Relocation: use relocation records to patch code**
    - **Output: DATA section, RODATA section, BSS section, TEXT section**

5. Under the Hood: Service Levels Tour

- **Exceptions and processes**
  - **Exceptions**
    - **Synchronous vs. asynchronous**
    - **Interrupts, traps, faults, and aborts**
  - **Traps and system-level functions in ARMv8**
  - **The process abstraction**
  - **The illusion of private address space**
    - **Reality: virtual memory via page faults**
  - **The illusion of private control flow**
    - **Reality: context switches during exception handling**

- **Storage management**
  - **Locality of reference and caching**
  - **Typical storage hierarchy: registers vs. cache vs. memory vs. local secondary storage vs. remote secondary storage**
  - **Virtual memory**
    - **Implementation of virtual memory**
      - **Virtual addresses vs. physical addresses**
      - **Page tables, page faults**
    - **Benefits of virtual memory**
- **Dynamic memory management (DMM)**
  - **The need for DMM**
  - **DMM using the heap section**
    - **The `brk()` and `sbrk()` system-level functions**
    - **Internal and external fragmentation**
    - **Minimal, pad, free-list, doubly-linked free list, bins implementations**
  - **DMM using virtual memory**
    - **The `mmap()` and `munmap()` system-level functions**
- **Process management**
  - **Creating processes**
    - **The `getpid()` and `fork()` system-level function**
  - **Waiting for (reaping, harvesting) processes**
    - **The `wait()` system-level function**
  - **Executing new programs**
    - **The `execvp()` system-level functions**
  - **The `system()` function**
- **I/O management**
  - **The file abstraction**
  - **Linux I/O**
    - **File descriptors, file descriptor tables, file tables**
    - **The `creat()`, `open()`, `close()`, `read()`, `write()` system-level functions**
  - **Standard C I/O**
    - **Buffering**
    - **Implementing standard C I/O using Linux I/O**
  - **Redirecting standard files**
    - **The `dup()` and `dup2()` system-level functions**
  - **Pipes**
    - **The `pipe()` system-level function**
- **Signals and alarms**
  - **Sending signals**
    - **Via keystrokes, the kill command, and the `raise()` and `kill()` functions**
  - **Handling signals**
    - **The `signal()` function**
    - **The `SIG_IGN` and `SIG_DFL` arguments to `signal()`**
  - **Alarms**
    - **The `alarm()` function**

6. Applications

- De-commenting
- Lexical analysis using finite state automata
- String manipulation
- Symbol tables, linked lists, hash tables
- Dynamically expanding arrays
- **High-precision addition**
- **Buffer overrun attacks**

Heap management
Linux shells

7. Tools: The Linux/GNU programming environment

Linux
`bash`
`emacs`
`gcc`
`gdb` for C
`make`
`gprof`
`gdb` for assembly language
`objdump`

Readings

As specified by the course Schedule *Web page.*

Required:

C Programming (King): 1, 2, 3, 4, 5, 6, 7, 8, 9, **10**, 11, 12, 13, 14, 15, 16, 17, **18**, 19, 20.1, 22, 24.1, **24.2, 24.3**
Computer Systems (Bryant & O'Hallaron): 1, **8.1-5**, **9**
ARM 64-bit Assembly Language (Pyeatt with Ughetta): 1, **2, 3, 4, 5, 6, 7**
***The C Programming Language* (Kernighan & Ritchie) 8.7**

Recommended:

Computer Systems (Bryant & O'Hallaron): 2, **5.1-5**, **6**, **7**, **10**
The Practice of Programming (Kernighan & Pike): 1, 2, 4, 5, 6, **7**, 8
Unix Tutorial for Beginners (website)
GNU Emacs Tutorial (website)
Linux Pocket Guide (Barrett)
Deterministic Finite Automaton Wikipedia article (website)
GNU GDB Tutorial (website)
GNU Make Tutorial (website)
***GNU Gprof Tutorial* (website)**
