Voxels And Stuff

[*Fast Multiresolution Image Querying*, Charles Jacobs, Adam Finkelstein, David Salesin]

Multiresolutional Analysis

- Describe the multiresolution approach for images
- Generalize this approach to three dimensional voxel grids
- Discuss

Multiresolution analysis for Images

- Generation of image signature
- Defining the image querying metric
- Specifying a data-structure for queries

Image Signature 2

- Truncate: Find the *m* largest coefficients and set all others equal to zero
- Quantize: Set the non-zero coefficients to +1 or -1 depending on their sign

<section-header>

Truncated And Quantized to 5000

Truncated And Quantized to 500

Data Structure 1

Preprocessing:

- The images in the database are truncated and quantized.
- Two 2-D arrays, D⁺ and D⁻ are generated, with D⁺[i,j], respectively D⁻[i,j] indexing the list of images with high positive, respectively negative, wavelet coefficients.

Given a query image:

- The image is truncated and quantized giving a 2-D array Q with (-1,0,1) as entries
- A scoring array indexing all database elements is generated.
- For each indexing pair (i,j) with Q[i,j]>0, the elements in D⁺ are used to update the scoring array (same for Q[i,j]<0)

Data Structure 3

The n best scoring database images are selected.

3D Generalization of this method to a voxel grid is immediate. The big trick is establishing a good choice of weights. [http://www.cl.cam.ac.uk/~jeg24/PUBLICATIONS/SKETCHES/WAVELET/sld001.htm]

Discussion 1

- Very Fast: (Works in a fraction of a second on databases of 20,000 images)
- + The use of a Haar basis makes obtaining the signature very fast
- + Invariant under small amounts of noise and perturbations

Discussion 2

- The query method is not hierarchical (i.e. O(n)) and hence is not satisfactory for large image/voxel databases (e.g. the web)
- It does not allow for affine transformations
- The Haar basis is anistropic

Discussion 3

- Even with a guarantee that it finds roughly the true target within 1% of the database, this becomes ineffective for large databases.
- The weights for the "metric" are determined after coefficients are discarded.
