

4.1, 4.2 Analysis of Algorithms

As soon as an Analytic Engine exists, it will necessarily guide the future course of the science. Whenever any result is sought by its aid, the question will arise - By what course of calculation can these results be arrived at by the machine in the shortest time? - Charles Babbage

Charles Babbage (1864)

Analytic Engine (schematic)

Overview

Analysis of algorithms. Framework for comparing algorithms and predicting performance.

Scientific method.

- **Observe** some feature of the universe.
- **Hypothesize** a model that is consistent with observation.
- **Predict** events using the hypothesis.
- **Verify** the predictions by making further observations.
- **Validate** the theory by repeating the previous steps until the hypothesis agrees with the observations.

Universe = computer itself.

Algorithmic Successes

N-body Simulation.

- Simulate gravitational interactions among N bodies.
- Brute force: N^2 steps.
- Barnes-Hut: $N \log N$ steps, **enables new research.**

Andrew Appel
PU '81

Discrete Fourier transform.

- Break down waveform of N samples into periodic components.
- Applications: DVD, JPEG, MRI, astrophysics, ...
- Brute force: N^2 steps.
- FFT algorithm: $N \log N$ steps, **enables new technology.**

Friedrich Gauss
1805

Sorting.

- Rearrange N items in ascending order.
- Fundamental information processing abstraction, **enables commerce.**

Jon von Neumann
IAS 1945

Case Study: Sorting

Sorting problem. Rearrange N items in ascending order.

Applications. Statistics, databases, data compression, computational biology, computer graphics, scientific computing, ...

5

Insertion Sort

6

Insertion Sort

Insertion sort.

- Brute-force sorting solution.
- Move left-to-right through array.
- Exchange next element with larger elements to its left, one-by-one.

7

Insertion Sort: Java Implementation

```
public class Insertion {  
    private static boolean less(double x, double y) {  
        return (x < y);  
    }  
  
    private static void exch(double[] a, int i, int j) {  
        double swap = a[i];  
        a[i] = a[j];  
        a[j] = swap;  
    }  
    // sorting helper functions  
  
    public static void sort(double[] a) {  
        for (int i = 0; i < a.length; i++) {  
            for (int j = i; j > 0; j--) {  
                if (less(a[j], a[j-1]))  
                    exch(a, j, j-1);  
                else break;  
            }  
        }  
    }  
    // insertion sort  
}
```

8

Insertion Sort: Observation

Observe and tabulate running time for various values of N.

- Data source: N random numbers between 0 and 1.
- Machine: Apple G5 1.8GHz with 1.5GB memory running OS X.
- Timing: Skagen wristwatch.

N	Comparisons	Time
5,000	6.2 million	0.13 seconds
10,000	25 million	0.43 seconds
20,000	99 million	1.5 seconds
40,000	400 million	5.6 seconds
80,000	1600 million	23 seconds

Insertion Sort: Experimental Hypothesis

Data analysis. Plot # comparisons vs. input size on log-log scale.

Regression. Fit line through data points $\sim aN^b$. power law
Hypothesis. # comparisons grows quadratically with input size $\sim N^2/4$. slope

9

10

Insertion Sort: Prediction and Verification

Experimental hypothesis. # comparisons $\sim N^2/4$.

Prediction. 400 million comparisons for $N = 40,000$.

Observations.

N	Comparisons	Time
40,000	401.3 million	5.595 sec
40,000	399.7 million	5.573 sec
40,000	401.6 million	5.648 sec
40,000	400.0 million	5.632 sec

Agrees.

Prediction. 10 billion comparisons for $N = 200,000$.

Observation.

N	Comparisons	Time
200,000	9.997 billion	145 seconds

Agrees.

Insertion Sort: Validation

Number of comparisons depends on input family.

- Descending: $N^2/2$.
- Random: $N^2/4$.
- Ascending: N .

11

12

Insertion Sort: Theoretical Hypothesis

Experimental hypothesis.

- Measure running times, plot, and fit curve.
- Model useful for predicting, but not for explaining.

Theoretical hypothesis.

- Analyze **algorithm** to estimate # comparisons as a function of:
 - number of elements N to sort
 - average or worst case input
- Model useful for predicting and **explaining**.

Critical difference. Theoretical model is independent of a particular machine or compiler; applies to machines not yet built.

13

Insertion Sort: Analysis

Worst case. (descending)

- Iteration i requires i comparisons.
- Total = $(0 + 1 + 2 + \dots + N-1) \sim N^2 / 2$ compares.

Average case. (random)

- Iteration i requires i/2 comparisons on average.
- Total = $(0 + 1 + 2 + \dots + N-1) / 2 \sim N^2 / 4$ compares

14

Insertion Sort: Theoretical Hypothesis

Theoretical hypothesis.

Analysis	Comparisons	Stddev
Worst	$N^2 / 2$	-
Average	$N^2 / 4$	$1/6 N^{3/2}$
Best	N	-

Validation. Theory agrees with observations.

N	Actual	Predicted
40,000	401.3 million	400 million
200,000	9.9997 billion	10.000 billion

15

Insertion Sort: Lesson

Lesson. Supercomputer can't rescue a bad algorithm.

Computer	Comparisons Per Second	Thousand	Million	Billion
laptop	10^7	instant	1 day	3 centuries
super	10^{12}	instant	1 second	2 weeks

16

Moore's Law

Moore's law. Transistor density on a chip doubles every 2 years.

Variants. Memory, disk space, bandwidth, computing power per \$.

17

Moore's Law and Algorithms

Quadratic algorithms do not scale with technology.

- New computer may be 10x as fast.
- But, has 10x as much memory so problem may be 10x bigger.
- With quadratic algorithm, takes 10x as long!

Software inefficiency can always outpace Moore's Law.
Moore's Law isn't a match for our bad coding. - Jaron Lanier

Lesson. Need linear algorithm to keep pace with Moore's law.

18

Mergesort

**First Draft
of a
Report on the
EDVAC**

John von Neumann

19

Mergesort

Mergesort.

- Divide array into two halves.
- Recursively sort each half.
- Merge two halves to make sorted whole.

input

M E R G E S O R T E X A M P L E

sort left

E E G M O R R S T E X A M P L E

sort right

E E G M O R R S A E E L M P T X

merge

A E E E E G L M M O P R R S T X

20

Mergesort: Example

M	E	R	G	E	S	O	R	T	E	X	A	M	P	L	E
E	M	R	G	E	S	O	R	T	E	X	A	M	P	L	E
E	M	G	R	E	S	O	R	T	E	X	A	M	P	L	E
E	G	M	R	E	S	O	R	E	T	A	X	M	P	E	L
E	M	G	R	E	S	O	R	T	E	X	A	M	P	L	E
E	M	G	R	E	S	O	R	T	E	X	A	M	P	L	E
E	G	M	R	E	O	R	S	E	T	A	X	M	P	E	L
E	E	G	M	O	R	R	S	A	E	T	X	E	L	M	P
E	M	G	R	E	S	O	R	E	T	X	A	M	P	L	E
E	M	G	R	E	S	O	R	E	T	A	X	M	P	L	E
E	G	M	R	E	O	R	S	A	E	T	X	M	P	E	L
E	M	G	R	E	S	O	R	E	T	A	X	M	P	L	E
E	M	G	R	E	S	O	R	E	T	A	X	M	P	E	L
E	G	M	R	E	O	R	S	A	E	T	X	E	L	M	P
E	E	G	M	O	R	R	S	A	E	E	L	M	P	T	X
A	E	E	E	E	G	L	M	M	O	P	R	R	S	T	X

Merging

Merging. Combine two pre-sorted lists into a sorted whole.

How to merge efficiently? Use an auxiliary array. 

```
private static void merge(double[] a, double[] aux, int l, int m, int r) {
    for (int k = l; k < r; k++) aux[k] = a[k];
    int i = l, j = m;
    for (int k = l; k < r; k++) {
        if (i >= m) a[k] = aux[j++];
        else if (j >= r) a[k] = aux[i++];
        else if (less(aux[j], aux[i])) a[k] = aux[j++];
        else a[k] = aux[i++];
    }
}
```

21

22

Mergesort: Java Implementation

```
public class Merge {
    private static boolean less(double x, double y)
        // as before

    private static void merge(double[] a, double[] aux, int l, int m, int r) {
        // see previous slide

    private static void sort(double[] a, double[] aux, int l, int r) {
        if (r <= l + 1) return;
        int m = l + (r - l) / 2;
        sort(a, aux, l, m);
        sort(a, aux, m, r);
        merge(a, aux, l, m, r);
    }

    public static void sort(double[] a) {
        double[] aux = new double[a.length];
        sort(a, aux, 0, a.length);
    }
}
```

23

Mergesort: Preliminary Hypothesis

Experimental hypothesis. Number of comparisons ~ 20N.

24

Mergesort: Prediction and Verification

Experimental hypothesis. Number of comparisons $\sim 20N$.

Prediction. 80 million comparisons for $N = 4$ million.

Observations.

N	Comparisons	Time
4 million	82.7 million	3.13 sec
4 million	82.7 million	3.25 sec
4 million	82.7 million	3.22 sec

Prediction. 400 million comparisons for $N = 20$ million.

Observations.

N	Comparisons	Time
20 million	460 million	17.5 sec
50 million	1216 million	45.9 sec

Agrees.

Not quite.

Mergesort: Analysis

Analysis. To mergesort array of size N , mergesort two subarrays of size $N/2$, and merge them together using $\leq N$ comparisons.

we assume N is a power of 2

25

26

Mergesort: Theoretical Hypothesis

Theoretical hypothesis.

Analysis	Comparisons
Worst	$N \log_2 N$
Average	$N \log_2 N$
Best	$1/2 N \log_2 N$

Validation. Theory now agrees with observations.

N	Actual	Predicted
10,000	120 thousand	133 thousand
20 million	460 million	485 million
50 million	1,216 million	1,279 million

27

Mergesort: Lesson

Lesson. Great algorithms can be more powerful than supercomputers.

Computer	Comparisons Per Second	Insertion	Mergesort
laptop	10^7	3 centuries	3 hours
super	10^{12}	2 weeks	instant

$N = 1$ billion

28

Scientific Method

Scientific method applies to estimate running time.

- Experimental analysis: not difficult to perform experiments.
- Theoretical analysis: may require advanced mathematics.
- Small subset of mathematical functions suffice to describe running time of many fundamental algorithms.

$\log_2 N$	<pre>while (N > 1) { N = N / 2; ... }</pre>	$N \log_2 N$	<pre>public static void g(int N) { if (N == 0) return; g(N/2); g(N/2); for (int i = 0; i < N; i++) ... }</pre>
N	<pre>for (int i = 0; i < N; i++) ...</pre>		<pre>public static void f(int N) { if (N == 0) return; f(N-1); f(N-1); ... }</pre>
N^2	<pre>for (int i = 0; i < N; i++) for (int j = 0; j < N; j++) ...</pre>	2^N	

29

Order of Growth Classifications

Order of growth.

- Estimate running time as a function of input size N .
- Ignore lower order terms.
 - when N is large, terms are negligible
 - when N is small, we don't care
- Ex: $6N^3 + 17N^2 + 56 \sim 6N^3$.

Function	Description	When N doubles, running time
1	constant algorithm is independent of input size	does not change
$\log N$	logarithmic algorithm gets slightly slower as N grows	increases by a constant
N	linear algorithm is optimal for processing N inputs	doubles
$N \log N$	linearithmic algorithm scales to huge N	slightly more than doubles
N^2	quadratic algorithm is impractical for large N	quadruples
2^N	exponential algorithm is not usually practical	squares!

30

Summary

How can I evaluate the performance of my algorithm?

- Computational experiments.
- Theoretical analysis.

What if it's not fast enough?

- Understand why.
- Buy a faster computer.
- Find a better algorithm in a textbook.
- Discover a new algorithm.

Attribute	Better Machine	Better Algorithm
Cost	\$\$\$ or more.	\$ or less.
Applicability	Makes "everything" run faster.	Does not apply to some problems.
Improvement	Quantitative improvements.	Dramatic qualitative improvements possible.

31
