

# Duality, Universality, and Computability

- Q. What is a general-purpose computer?
- Q. Are there limits on the power of digital computers?
- Q. Are there limits on the power of machines we can build?

## Pioneering work in the 1930s.

- Princeton == center of universe.
- Hilbert, Gödel, Turing, Church, von Neumann.
- Automata, languages, computability, universality, complexity, logic.

David Hilbert

Kurt Gödel

Alan Turing

Alonzo Church

John von Neumann

## Turing Machine

**Desiderata.** Simple model of computation that is "as powerful" as conventional computers.

**Intuition.** Simulate how humans calculate.

**Ex.** Addition.

			1	2	3	4	5	6
		+	3	1	4	1	5	9

Alan Turing (1912-1954)

# 7.5 Turing Machines

## Turing Machine: Tape

### Tape.

- Stores input, output, and intermediate results.
- One arbitrarily long strip, divided into cells.
- Finite alphabet of symbols.

### Tape head.

- Points to one cell of tape.
- Reads a symbol from active cell.
- Writes a symbol to active cell.
- Moves left or right one cell at a time.

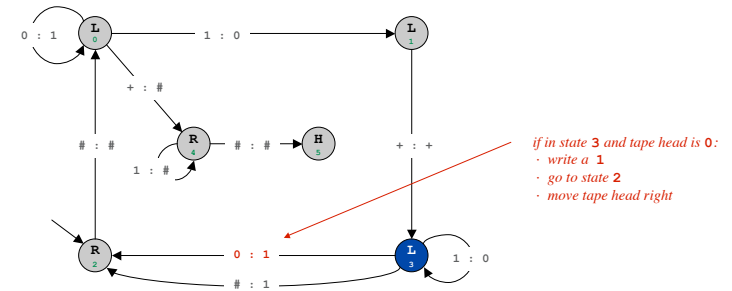

5

## Turing Machine: States

### State. What machine remembers.

State transition diagram. Complete description of what machine will do.

6

## Turing Machine: States

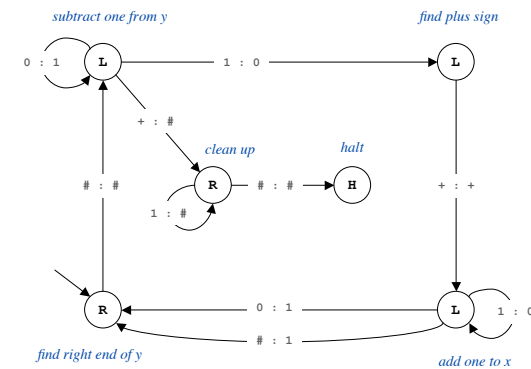

### State. What machine remembers.

State transition diagram. Complete description of what machine will do.

7

## Binary Adder

8

## Turing Machine: Initialization and Termination

**Initialization.** Set input on some portion of tape; set tape head.

**Termination.** Stop if enter yes, no, or halt state.

↖ infinite loop possible

9

## Duality of Program and Data

**Data.** Sequence of symbols (interpreted one way).

**Program.** Sequence of symbols (interpreted another way).

Program and data are interchangeable.

**Ex 1.** A **compiler** is a program that takes a program in one language as input and outputs a program in another language.

↖ machine language  
↖ Java

11

## Duality

10

## Duality of Program and Data

**Data.** Sequence of symbols (interpreted one way).

**Program.** Sequence of symbols (interpreted another way).

Program and data are interchangeable.

**Ex 2.** Self-replication. [von Neumann 1940s]

Print the following statement twice, the second time in quotes.  
"Print the following statement twice, the second time in quotes."

12

## Duality of Program and Data

**Data.** Sequence of symbols (interpreted one way).

**Program.** Sequence of symbols (interpreted another way).

Program and data are interchangeable.

Ex 3. Self-replication. [Watson-Crick 1953]

13

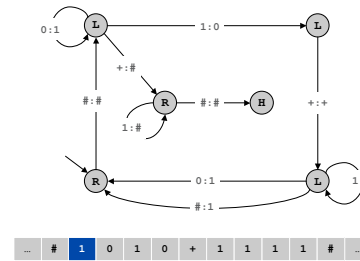

## Duality of Program and Data

**Data.** Sequence of symbols (interpreted one way).

**Program.** Sequence of symbols (interpreted another way).

Program and data are interchangeable.

Ex 4. Turing machine.

14

## Universality

### Universal Machines and Technologies

Cray

Dell PC

iMac

iPod

Printer

Xbox

Tivo

Turing machine

TOY

Java language

MS Excel

Blackberry

Quantum computer

DNA computer

Python language

15

16

## Universal Turing Machine

**Turing machine  $M$ .** Given input  $x$ , Turing machine  $M$  outputs  $M(x)$ .

**Universal Turing machine  $U$ .** Given input  $M$  and  $x$ , universal Turing machine  $U$  outputs  $M(x)$ .

**TM intuition.** Software program that solves **one** particular problem.

**UTM intuition.** Hardware platform that can implement **any** algorithm.

18

## Universal Turing Machine

**Consequences.** Your laptop (a UTM) can do **any** computational task.

- Java programming.
- Pictures, music, movies, games.
- Email, browsing, downloading files, telephony.
- Word-processing, finance, scientific computing.
- ...

even tasks not yet contemplated when laptop was purchased

Again, it [the Analytical Engine] might act upon other things besides numbers... the engine might compose elaborate and scientific pieces of music of any degree of complexity or extent. — Ada Lovelace

19

## Church-Turing Thesis

**Church Turing thesis (1936).** Turing machines can do anything that can be described by any physically harnessable process of this universe.

**Remark.** "Thesis" and not a mathematical theorem because it's a statement about the physical world and not subject to proof.

but can be falsified

**Implications.**

- No need to seek more powerful machines or languages.
- Enables rigorous study of computation (in this universe).

**Bottom line.** Turing machine is a **simple** and **universal** model of computation.

20

## Church-Turing Thesis: Evidence

**Evidence.**

- 7 decades without a counterexample.
- Many, many models of computation that turned out to be equivalent.

"universal"

model of computation	description
enhanced Turing machines	multiple heads, multiple tapes, 2D tape, nondeterminism
untyped lambda calculus	method to define and manipulate functions
recursive functions	functions dealing with computation on integers
unrestricted grammars	iterative string replacement rules used by linguists
extended L-systems	parallel string replacement rules that model plant growth
programming languages	Java, C, C++, Perl, Python, PHP, Lisp, PostScript, Excel
random access machines	registers plus main memory, e.g., TOY, Pentium
cellular automata	cells which change state based on local interactions
quantum computer	compute using superposition of quantum states
DNA computer	compute using biological operations on DNA

21

## 7.7 Computability

### Halting Problem

**Halting problem.** Write a Java function that reads in a Java function  $f$  and its input  $x$ , and decides whether  $f(x)$  results in an infinite loop.

Ex. Does  $f(x)$  terminate?

relates to famous open math conjecture

```
public void f(int x) {
    while (x != 1) {
        if (x % 2 == 0) x = x / 2;
        else x = 3*x + 1;
    }
}
```

- $f(6)$ : 6 3 10 5 16 8 4 2 1
- $f(27)$ : 27 82 41 124 62 31 94 47 142 71 214 107 322 ... 4 2 1
- $f(-17)$ : -17 -50 -25 -74 -37 -110 -55 -164 -82 -41 -122 ... -17 ...

24

25

### Undecidable Problem

A yes-no problem is **undecidable** if no Turing machine exists to solve it.

and (by universality) no Java program either

**Theorem.** [Turing 1937] The halting problem is undecidable.

**Proof intuition:** lying paradox.

- Divide all statements into two categories: truths and lies.
- How do we classify the statement: *I am lying*.

**Key element of lying paradox and halting proof:** self-reference.

### Halting Problem Proof

Assume the existence of  $\text{halt}(f, x)$ :

- Input: a function  $f$  and its input  $x$ .
- Output: true if  $f(x)$  halts, and false otherwise.
- Note:  $\text{halt}(f, x)$  does not go into infinite loop.

We prove by contradiction that  $\text{halt}(f, x)$  does not exist.

- *Reductio ad absurdum*: if any logical argument based on an assumption leads to an absurd statement, then assumption is false.

encode  $f$  and  $x$  as strings

```
public boolean halt(String f, String x) {
    if (something terribly clever) return true;
    else return false;
}
```

hypothetical halting function

26

27

## Halting Problem Proof

Assume the existence of  $\text{halt}(f, x)$ :

- Input: a function  $f$  and its input  $x$ .
- Output: true if  $f(x)$  halts, and false otherwise.

Construct function  $\text{strange}(f)$  as follows:

- If  $\text{halt}(f, f)$  returns true, then  $\text{strange}(f)$  goes into an infinite loop.
- If  $\text{halt}(f, f)$  returns false, then  $\text{strange}(f)$  halts.

↖  
 $f$  is a string so legal (if perverse)  
 to use for second input

```
public void strange(String f) {
    if (halt(f, f)) {
        // an infinite loop
        while (true) { }
    }
}
```

28

## Consequences

Q. Why is debugging hard?

A. All problems below are undecidable.

**Halting problem.** Give a function  $f$ , does it halt on a given input  $x$ ?

**Totality problem.** Give a function  $f$ , does it halt on every input  $x$ ?

**No input halting problem.** Give a function  $f$  with no input, does it halt?

**Program equivalence.** Do two functions  $f$  and  $g$  always return same value?

**Uninitialized variables.** Is the variable  $x$  initialized before it's used?

**Dead code elimination.** Does this statement ever get executed?

32

## Halting Problem Proof

Assume the existence of  $\text{halt}(f, x)$ :

- Input: a function  $f$  and its input  $x$ .
- Output: true if  $f(x)$  halts, and false otherwise.

Construct function  $\text{strange}(f)$  as follows:

- If  $\text{halt}(f, f)$  returns true, then  $\text{strange}(f)$  goes into an infinite loop.
- If  $\text{halt}(f, f)$  returns false, then  $\text{strange}(f)$  halts.

In other words:

- If  $f(f)$  halts, then  $\text{strange}(f)$  goes into an infinite loop.
- If  $f(f)$  does not halt, then  $\text{strange}(f)$  halts.

Call  $\text{strange}()$  with ITSELF as input.

- If  $\text{strange}(\text{strange})$  halts then  $\text{strange}(\text{strange})$  does not halt.
- If  $\text{strange}(\text{strange})$  does not halt then  $\text{strange}(\text{strange})$  halts.

Either way, a **contradiction**. Hence  $\text{halt}(f, x)$  cannot exist. 

31

## More Undecidable Problems

Hilbert's 10<sup>th</sup> problem.

Devise a process according to which it can be determined by a finite number of operations whether a given multivariate polynomial has an integral root.

- $f(x, y, z) = 6x^3y^2z^2 + 3xy^2 - x^3 - 10$ .      yes :  $f(5, 3, 0) = 0$ .
- $f(x, y) = x^2 + y^2 - 3$ .      no.

**Definite integration.** Given a rational function  $f(x)$  composed of polynomial and trig functions, does  $\int_{-\infty}^{+\infty} f(x) dx$  exist?

- $g(x) = \cos x (1 + x^2)^{-1}$       yes,  $\int_{-\infty}^{+\infty} g(x) dx = \pi/e$ .
- $h(x) = \cos x (1 - x^2)^{-1}$       no,  $\int_{-\infty}^{+\infty} h(x) dx$  undefined.

33

## More Undecidable Problems

**Optimal data compression.** Find the shortest program to produce a given string or picture.

Mandelbrot set (40 lines of code)

## More Undecidable Problems

**Virus identification.** Is this program a virus?

```
Private Sub AutoOpen()
On Error Resume Next
If System.PrivateProfileString("", CURRENT_USER\Software\Microsoft\Office\9.0\Word\Security",
"Level") <> "" Then
CommandBars("Macro").Controls("Security...").Enabled = False
. . .
For oo = 1 To AddyBook.AddressEntries.Count
Peep = AddyBook.AddressEntries(x)
BreakUmOffASlice.Recipients.Add Peep
x = x + 1
If x > 50 Then oo = AddyBook.AddressEntries.Count
Next oo
. . .
BreakUmOffASlice.Subject = "Important Message From " & Application.UserName
BreakUmOffASlice.Body = "Here is that document you asked for ... don't show anyone else ;-)"
. . .
```

Can write programs in MS Word.  
This statement disables security.

Melissa virus

## Context: Mathematics and Logic

**Mathematics.** Formal system powerful enough to express arithmetic.

Principia Mathematics  
Peano arithmetic  
Zermelo-Fraenkel set theory

**Complete.** Can prove truth or falsity of any arithmetic statement.

**Consistent.** Can't prove contradictions like  $2 + 2 = 5$ .

**Decidable.** Algorithm exists to determine truth of every statement.

Q. [Hilbert] Is mathematics complete and consistent?

A. [Gödel's Incompleteness Theorem, 1931] **No!!!**

Q. [Hilbert's Entscheidungsproblem] Is mathematics decidable?

A. [Church 1936, Turing 1936] **No!**

## Turing's Key Ideas

**Turing machine.**

formal model of computation

**Duality.**

encode program and data as sequence of symbols; use interchangeably

**Universality.**

concept of general-purpose, programmable computers

**Church-Turing thesis.**

computable at all == computable with a Turing machine

**Computability.**

inherent limits to computation

Hailed as one of top 10 science papers of 20<sup>th</sup> century.
