### 1.4 Arrays

Introduction to Programming in Java: An Interdisiciplinary Approach . Robert Sedgevick and Kevin Wayne Copyright © 2008 .

## Arrays

This lecture. Store and manipulate huge quantities of data.
Array. Indexed sequence of values of the same type.

## Examples.

- 52 playing cards in a deck
- 5 thousand undergrads at Princeton.
- 1 million characters in a book.
- 10 million audio samples in an MP3 file.
. 4 billion nucleotides in a DNA strand.
- 73 billion Google queries per year.
- 50 trillion cells in the human body.
- $6.02 \times 10^{23}$ particles in a mole.
any program you might want to write

Many Variables of the Same Type

Goal. 10 variables of the same type.

```
// tedious and error-prone
double a0, a1, a2, a3, a4, a5, a6, a7, a8, a9;
a0 = 0.0;
a1 = 0.0;
a2 = 0.0;
a3 = 0.0;
a3 = 0.0;
a4 = 0.0;
a5 = 0.0;
a6 = 0.0;
a7 = 0.0;
a8 = 0.0;
a9 = 0.0;
a4 = 3.0;
a4 = 8.0;
double x = a4 + a8;
```

Goal. 10 variables of the same type.

```
// easy alternative
double[] a = new double[10];
a[4] = 3.0;
a[8] = 8.0;
double x = a[4] + a[8]
```

Arrays in Java

Java has special language support for arrays.

- To make an array: declare, create, and initialize it.
- To access element i of array named a, use a [i].
- Array indices start at 0.

```
int N = 10; // size of array
double[] a;
a = new double[N];
for (int i = 0; i < N; i++) // initialize the array
    a[i] = 0.0;
// declare the array
// create the array
// all to 0.0
```

Goal. 1 million variables of the same type.

```
// scales to handle large arrays
```

// scales to handle large arrays
double[] a = new double[1000000];
double[] a = new double[1000000];
a[123456] = 3.0;
a[123456] = 3.0;
a[987654] = 8.0;
a[987654] = 8.0;
double x = a[123456] + a[987654];
double x = a[123456] + a[987654];
[123456] - 3.0

```
[123456] - 3.0
```

Dot product. Given two vectors $\mathrm{x}[\mathrm{]}$ and $\mathrm{y}[\mathrm{]}$ of length n , their dot product is the sum of the products of their corresponding components.

```
double[] x = { 0.3, 0.6, 0.1 };
double[] x = { 0.3, 0.6, 0.1 };
int N = x.length;
double sum = 0.0.
for (int i = 0; i < N; i++) {
    sum = sum + x[i]*y[i];
}
```

| $i$ | $x[i]$ | $y[i]$ | $x[i] * y[i]$ | sum |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | 0 |
| 0 | .30 | .50 | .15 | .15 |
| 1 | .60 | .10 | .06 | .21 |
| 2 | .10 | .40 | .04 | .25 |
|  |  |  |  | .25 |

```
double[] a = new double[N]
for (int i = 0; i < N; i++)
    a[i] = Math.random()
```

create an array with random values

```
double sum = 0.0;
for (int i = 0; i < N; i++)
    sum += a[i];
double average = sum / N;
```

compute the average of the array values
for (int i = 0; i < N i++) System. out println(a[i]);
print the array values, one per line

> double[] $b=$ new double[N]; for (int $\mathbf{i}=0 ; \mathbf{i}<\mathbf{N} ; \mathbf{i + +})$ $\quad b[\mathbf{i}]=a[\mathbf{i}] ;$
copy one array to another array

```
double max = Double.NEGATIVE INFINITY;
for (int i = 0; i < N; i++)
    if (a[i] > max
        max = a[i];
```

find the maximum of the array values

## Setting Array Values at Compile Time

Ex. Print a random card.

```
String[] rank = {
    "2", "3", "4", "5", "6", "7", "8", "9",
    "10", "Jack", "Queen", "King", "Ace"
};
String[] suit = {
    "Clubs", "Diamonds", "Hearts", "Spades"
};
int i = (int) (Math.random() * 13); // between 0 and 12
int j = (int) (Math.random() * 4); // between 0 and 3
System.out.println(rank[i] + " of " + suit[j]);
```

Ex. Create a deck of playing cards and print them out.

```
String[] deck = new String[52]
for (int i = 0; i < 13; i++)
    for (int j = 0; j < 4; j++)
        deck[4*i + j] = rank[i] + " of " + suit[j];
for (int i = 0; i < 52; i++)
    System.out.println(deck[i])
```

pical array-processing ode changes valu at runtime

```
for (int \(\mathbf{i}=0 ; \mathbf{i}<52 ; \mathbf{i + +}\)
System.out.println(deck[i])
```

## Q. In what order does it output them?

A. two of clubs two of diamonds two of hearts two of spades three of clubs
B. two of clubs
three of clubs four of clubs five of clubs six of clubs

Shuffling a Deck of Cards: Putting Everything Together

```
public class Deck {
    public static void main(String[] args) {
        String[] suit = { "Clubs", "Diamonds", "Hearts", "Spades" };
        String[] rank = { "2", "3", "4", "5", "6", "7", "8", "9",
        int SUITS = suit "10", "Jack", "Queen", "King", "Ace" };
        int SUITS = suit.length;
        int RANKS = rank.length
        int N = SUITS * RANKS
        String[] deck = new String[N]; build the deck
                deck[SUITS*i + j] = rank[i] + " of " + suit[j];
        for (int i = 0; i < N; i++) {
            int r=i + (int) (Math.random() * (N-i)). shuffle
            String t = deck[r];
            deck[r] = deck[i];
            deck[i] = t
        }
        for (int i = 0; i < N; i++)
            System.out.println(deck[i])

\section*{Coupon Collector}

\section*{Coupon Collector: Java Implementation}
```

public class CouponCollector {
public static void main(String[] args) {
int N = Integer.parseInt(args[0]);
int cardcnt = 0; // number of cards collected
int valcnt = 0; // number of distinct cards
// do simulation
boolean[] found = new boolean[N]
while (valcnt < N) {
int val = (int) (Math.random() * N);
cardent++;
if (!found[val]) { lype of next card
valent++;
found[val] = true;
}
}
// all N distinct cards found
System.out.println(cardent)
}
}

```

Coupon collector problem. Given n different card types, how many do you have to collect before you have (at least) one of each type?

assuming each possibility is equally likely for each card that you collect

Simulation algorithm. Repeatedly choose an integer i between 0 and \(\mathrm{N}-1\). Stop when we have at least one card of every type.
Q. How to check if we've seen a card of type i?
A. Maintain a boolean array so that found [i] is true if we've already collected a card of type i.

\section*{Coupon Collector: Debugging}

\section*{Debugging. Add code to print contents of all variables.}
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline \multirow[b]{2}{*}{val} & \multicolumn{4}{|c|}{found} & \multirow[b]{2}{*}{valcnt} & \multirow[b]{2}{*}{cardent} \\
\hline & 0 & 12 & 23 & 4 & & \\
\hline & F & F F & F F & F & 0 & 0 \\
\hline 2 & F & F T & T F & & 1 & 1 \\
\hline 0 & T & F T & T F & & 2 & 2 \\
\hline 4 & T & F T & T F & & 3 & 3 \\
\hline 0 & T & F T & T F & & 3 & 4 \\
\hline 1 & T & T T & T F & & 4 & 5 \\
\hline 2 & T & T T & T F & & 4 & 6 \\
\hline 5 & T & T 7 & T F & & 5 & 7 \\
\hline 0 & T & T 7 & T F & & 5 & 8 \\
\hline 1 & & T T & T F & & 5 & 9 \\
\hline 3 & T & T 7 & T T & & 6 & 10 \\
\hline
\end{tabular}

Challenge. Debugging with arrays requires tracing many variables.

Coupon collector problem. Given \(N\) different possible cards, how many do you have to collect before you have (at least) one of each type?

Fact. About \(\mathrm{N}(1+1 / 2+1 / 3+\ldots+1 / \mathrm{N}) \sim \mathrm{N} \ln \mathrm{N}\).
\(\backslash\) see ORF 245 or \(\cos 340\)

Ex. \(N=30\) baseball teams. Expect to wait \(\approx 120\) years before all teams win a World Series.
under idealized assumptions
Q. Given a sequence from nature, does it have same characteristics as a random sequence?
A. No easy answer - many tests have been developed.

Coupon collector test. Compare number of elements that need to be examined before all values are found against the corresponding answer for a random sequence.

Two-Dimensional Arrays

Two-dimensional arrays.
- Table of data for each experiment and outcome.
- Table of grades for each student and assignments.
- Table of grayscale values for each pixel in a 2D image.

Mathematical abstraction. Matrix.
Java abstraction. 2D array.

Array access. Use a[i][j] to access element in row \(i\) and column \(j\).

\section*{Zero-based indexing. Row and column indices start at 0 .}
```

int M = 10;
int N = 3;
double[][] a = new double[M][N]
for (int i = 0; i < M; i++) {
for (int j = 0; j < N; j++) {
a[i][j] = 0.0;
}
}

```

\section*{Matrix Addition}

Matrix addition. Given two N -by-N matrices a and b , define c to be the \(N\)-by- N matrix where \(\mathrm{c}[\mathrm{i}][j]\) is the sum a[i][j]+b[i][j].
```

double[][] c = new double[N][N];
for (int i = 0; i < N; i++)
for (int j = 0; j < N ; j++)
c[i][j] = a[i][j] + b[i][j];

```

Initialize 2D array by listing values.
```

double[][] p = {
{.02,.92,.02,.02,.02 },
{ . 02, .02,.32,.32,. 32 },
{ .02,.02,.02,.92,.02 },
{.92,.02,.02,.02,.02 },
{.47, .02, .47,.02,.02 },
};

```

\section*{Matrix Multiplication}

Matrix multiplication. Given two N-by-N matrices a and \(b\), define \(c\) to be the N -by- N matrix where \(\mathrm{c}[\mathrm{i}][j]\) is the dot product of the \(i^{\text {th }}\) row of \(a\) and the \(j^{\text {th }}\) column of \(b\).

Q. How many scalar multiplications multiply two N -by-N matrices?
A. N
B. \(\mathrm{N}^{2}\)
c. \(\mathrm{N}^{3}\)
D. \(\mathrm{N}^{4}\)
```

double[][] c = new double[N][N];
for (int i = 0; i < N; i++)
for (int j = 0; j < N; j++)
for (int k = 0; k < N; k++)
c[i][j] += a[i][k] * b[k][j];

```

\section*{Arrays.}
- Organized way to store huge quantities of data.
- Almost as easy to use as primitive types.
- Can directly access an element given its index.

Ahead. Reading in large quantities of data from a file into an array.

http://imgs.xkcd.com/comics/donald_knuth. png```
