

## Assemblers and Linkers

1

---

---

---

---

---

---

---

---

### Goals for this Lecture

- Help you to learn about:
  - IA-32 machine language
  - The assembly and linking processes

2

---

---

---

---

---

---

---

---

### Why Learn Machine Language

- Machine language is the last stop on the “language levels” tour
- A power programmer knows about the relationship between assembly language and machine language
- A systems programmer knows how an assembler translates assembly language to machine language

3

---

---

---

---

---

---

---

---

## Part 1: Machine Language

4

---

---

---

---

---

---

---

---

- 
- ### IA-32 Machine Language
- IA-32 machine language
    - Difficult to generalize about IA-32 instruction format
      - Many (most!) instructions are exceptions to the rules
    - Generally, instructions use the following format shown in following slides
  - We'll go over
    - The format of instructions
    - Two example instructions
  - Just to give a sense of how it works...
- 5

---

---

---

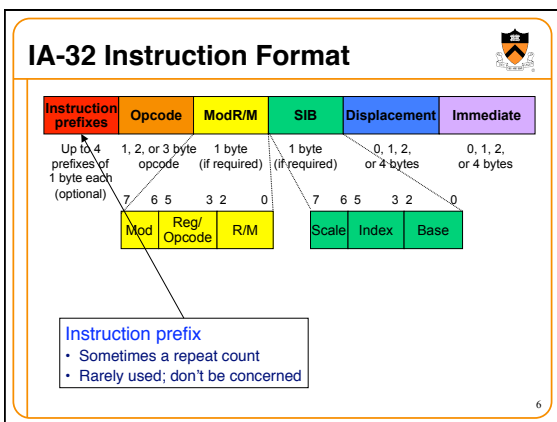

---

---

---

---

---

---

---

---

---

---

---

---

---

## IA-32 Instruction Format (cont.)

### Opcode

- Specifies which operation should be performed
- Add, move, call, etc.

7

---

---

---

---

---

---

---

---

---

---

## IA-32 Instruction Format (cont.)

### ModR/M

- Specifies types of operands (immediate, register, memory)
- Specifies sizes of operands (byte, word, long)
- Sometimes denotes a register:  
000 = EAX/AL; 011 = EBX/BL; 001 = ECX/CL; 010 = EDX/DL;  
110 = ESI/DH; 111 = EDI/BH; 101 = EBP/CH; 110 = ESP/AH
- Sometimes contains an extension of the opcode

8

---

---

---

---

---

---

---

---

---

---

## IA-32 Instruction Format (cont.)

### SIB

- Used when one of the operands is a memory operand that uses a scale, an index register, and/or a base register

9

---

---

---

---

---

---

---

---

---

---

## IA-32 Instruction Format (cont.)

### Displacement

- Used in jump and call instructions
- Indicates the displacement between the destination instruction and the jump/call instruction
- More precisely, indicates: [addr of destination instr] – [addr of instr following the jump/call]
- Uses little-endian byte order

10

---

---

---

---

---

---

---

---

---

---

## IA-32 Instruction Format (cont.)

### Immediate

- Specifies an immediate operand
- Uses little-endian byte order

11

---

---

---

---

---

---

---

---

---

---

## Example: Push on to Stack

- Assembly language:

`pushl %edx`

- Machine code:

- IA32 has a separate opcode for push for each register operand
  - 50: `pushl %eax`
  - 51: `pushl %ecx`
  - 52: `pushl %edx` → 0101 0010
  - ...

- Results in a *one-byte* instruction

- Observe: sometimes one assembly language instruction can map to a *group* of different opcodes

12

---

---

---

---

---

---

---

---

---

---

## Example: Load Effective Address

- Assembly language:

```
leal (%eax,%eax,4), %eax
```

- Machine code:

- Byte 1: 8D (opcode for "load effective address")

1000 1101
-----------

- Byte 2: 04 (dest %eax, with scale-index-base)

0000 0100
-----------

- Byte 3: 80 (scale=4, index=%eax, base=%eax)

1000 0000
-----------

Load the address  $\%eax + 4 * \%eax$  into register %eax

13

---

---

---

---

---

---

---

---

## CISC and RISC

- IA-32 machine language instructions are **complex**

- IA-32 is a

- **Complex Instruction Set Computer (CISC)**

- Alternative:

- **Reduced Instruction Set Computer (RISC)**

14

---

---

---

---

---

---

---

---

## Characteristics of CISC and RISC

- CISC

- **Many** instructions
- **Many** addressing modes (direct, indirect, indexed, base-pointer)
- Hardware interpretation is **complex**
- **Few** instructions required to accomplish a given job (expressive)
- Example: IA-32

- RISC

- **Few** instructions
- **Few** addressing modes (typically only direct and indirect)
- Hardware interpretation is **simple**
- **Many** instructions required to accomplish a given job (not expressive)
- Examples: MIPS, SPARC

15

---

---

---

---

---

---

---

---

## Brief History of CISC and RISC

- **Stage 1: Programmers write assembly language**
  - Important that assembly/machine language be expressive
  - CISC dominates (esp. Intel)
- **Stage 2: Programmers write high-level language**
  - Not important that assembly/machine language be expressive; the compiler generates it
  - Important that compilers work well => assembly/machine language should be simple
  - RISC takes a foothold (but CISC, esp. Intel, persists)
- **Stage 3: Compilers get smarter**
  - Less important that assembly/machine language be simple
  - Much motivation for RISC disappears
  - CISC (esp. Intel) dominates the computing world

16

---

---

---

---

---

---

---

---

## Part 2: The Assembly Process

17

---

---

---

---

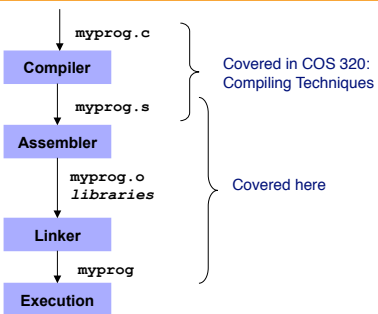

---

---

---

---

## The Build/Execute Process

18

---

---

---

---

---

---

---

---

## Two Aspects of the Assembler/Linker

- **Translating each instruction**
  - Mapping an assembly-language instruction
  - ... into the corresponding machine-language instruction
- **Dealing with references across instructions**
  - Jumps to other locations in same chunk of code
  - Accesses a global variable by the name of its memory location
  - Calling to and returning from functions defined in other code

```
main:    pushl   %ebp
        movl   %esp, %ebp
        call  getchar
        cmpl  '$A', %eax
        jne   skip
        pushl $msg
        call  printf
        addl  $4, %esp
skip:    movl   $0, %eax
        movl  %ebp, %esp
        popl  %ebp
        ret
```

19

---

---

---

---

---

---

---

---

## References Across Instructions

- **Many instructions can be assembled independently**
  - `pushl %edx`
  - `leal (%eax, %eax, 4), %eax`
  - `movl $0, %eax`
  - `addl %ebx, %ecx`
- **But, some make references to other data or code**
  - `jne skip`
  - `pushl $msg`
  - `call printf`
- **Need to fill in those references**
  - To generate a final executable binary

20

---

---

---

---

---

---

---

---

## The Forward Reference Problem

- **Problem**

```
...
    jmp mylabel
...
mylabel:
...
```

Any assembler must deal with the forward reference problem

- Assembler must generate machine language code for "jmp mylabel"
- But assembler hasn't yet *seen* the definition of mylabel
  - I.e., the jmp instruction contains a **forward reference** to mylabel

21

---

---

---

---

---

---

---

---

## The Forward Reference Solution

- Solution
  - Assembler performs **2 passes** over assembly language program
- Different assemblers perform different tasks in each pass
- One straightforward design...

22

---

---

---

---

---

---

---

---

## Assembler Passes

- Pass 1
  - Assembler traverses assembly program to create...
  - **Symbol table**
    - Key: label
    - Value: information about label
      - Label name, which section, what offset within that section, ...
- Pass 2
  - Assembler traverses assembly program again to create...
  - **RODATA section**
  - **DATA section**
  - **BSS section**
  - **TEXT section**
  - **Relocation record section**
    - Each relocation record indicates an area that the linker must patch

23

---

---

---

---

---

---

---

---

## An Example Program

- A simple (nonsensical) program:

```
#include <stdio.h>
int main(void) {
    if (getchar() == 'A')
        printf("Hi\n");
    return 0;
}
```

- Let's consider how the assembler handles that program...

```
.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
```

24

---

---

---

---

---

---

---

---

### Assembler Data Structures (1)

- Symbol Table
 

Label	Section	Offset	Local?	Seq#
- Relocation Records
 

Section	Offset	Rel Type	Seq#
- RODATA Section (location counter: 0)
 

Offset	Contents	Explanation

  - No DATA or BSS section in this program
  - Initially all sections are empty
- TEXT Section (location counter: 0)
 

Offset	Contents	Explanation

25

---

---

---

---

---

---

---

---

### Assembler Pass 1

```

msg:  .section ".rodata"
      .asciz "Hi\n"
      .section ".text"
      .globl main
main:  pushl %ebp
      movl %esp, %ebp
      call getchar
      cpl $'A', %eax
      jne skip
      pushl $msg
      call printf
      addl $4, %esp
skip:  movl $0, %eax
      movl %ebp, %esp
      popl %ebp
      ret
  
```

- Assembler notes that the current section is RODATA
- Assembler adds binding to Symbol Table...

26

---

---

---

---

---

---

---

---

### Assembler Data Structures (2)

- Symbol Table
 

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0

  - msg marks a spot in the RODATA section at offset 0
  - msg is a local label
  - Assign msg sequence number 0
- Relocation Records
  - (Same)
- RODATA Section (location counter: 0)
  - (Same)
- TEXT Section (location counter: 0)
  - (Same)

27

---

---

---

---

---

---

---

---

## Assembler Pass 1 (cont.)

```

.section ".rodata"
msg: .asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
    
```

Assembler increments RODATA section location counter by byte count of the string (4)...

28

---

---

---

---

---

---

---

---

## Assembler Data Structures (3)

- Symbol Table

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0

- Relocation Records

- (Same)

- RODATA Section (location counter: 4)

- (Same)

- TEXT Section (location counter: 0)

- (Same)

• RODATA location counter now is 4  
 • If another label were defined in at this point, it would mark a spot in RODATA at offset 4

29

---

---

---

---

---

---

---

---

## Assembler Pass 1 (cont.)

```

.section ".rodata"
msg: .asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
    
```

Assembler notes that current section is TEXT

Assembler does nothing

Assembler adds binding to Symbol Table...

30

---

---

---

---

---

---

---

---

## Assembler Data Structures (4)

### • Symbol Table

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0
main	TEXT	0	local	1

- main marks a spot in the TEXT section at offset 0
- main is a local label (assembler will discover otherwise in Pass 2)
- Assign main sequence number 1

### • Relocation Records

- (Same)

### • RODATA Section (location counter: 4)

- (Same)

### • TEXT Section (location counter: 0)

- (Same)

31

---

---

---

---

---

---

---

---

## Assembler Pass 1 (cont.)

```

.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl  %esp, %ebp
    call  getchar
    cml  '$A', %eax
    jne  skip
    pushl $msg
    call  printf
    addl  $4, %esp
skip:
    movl  $0, %eax
    movl  %ebp, %esp
    popl  %ebp
    ret
    
```

- Assembler increments TEXT section location counter by the length of each instruction...

32

---

---

---

---

---

---

---

---

## Assembler Data Structures (5)

### • Symbol Table

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0
main	TEXT	0	local	1

### • Relocation Records

- (Same)

### • RODATA Section (location counter: 4)

- (Same)

### • TEXT Section (location counter: 26)

- (Same)

- TEXT location counter now is 26
- If another label were defined at this point, it would mark a spot in TEXT at offset 26

33

---

---

---

---

---

---

---

---

## Assembler Pass 1 (cont.)

```

.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cml $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
    
```

Assembler adds binding to Symbol Table...

34

---

---

---

---

---

---

---

---

## Assembler Data Structures (6)

- Symbol Table

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0
main	TEXT	0	local	1
skip	TEXT	26	local	2

- skip marks a spot in the TEXT section at offset 26
- skip is a local label
- Assign skip sequence number 2

- Relocation Records
  - (Same)

- RODATA Section (location counter: 4)
  - (Same)

- TEXT Section (location counter: 26)
  - (Same)

35

---

---

---

---

---

---

---

---

## Assembler Pass 1 (cont.)

```

.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cml $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
    
```

Assembler increments TEXT section location counter by the length of each instruction...

36

---

---

---

---

---

---

---

---

## Assembler Data Structures (7)

- Symbol Table

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0
main	TEXT	0	local	1
skip	TEXT	26	local	2

- Relocation Records

- (Same)

- RODATA Section (location counter: 4)

- (Same)

- TEXT Section (location counter: 35)

- (Same)

• TEXT location counter now is 35  
 • If another label were defined at this point, it would mark a spot in TEXT at offset 35

37

---

---

---

---

---

---

---

---

## From Assembler Pass 1 to Pass 2

- End of Pass 1

- Assembler has (partially) created Symbol Table
- So assembler now knows which location each label marks

- Beginning of Pass 2

- Assembler resets all section location counters...

38

---

---

---

---

---

---

---

---

## Assembler Data Structures (8)

- Symbol Table

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0
main	TEXT	0	local	1
skip	TEXT	26	local	2

- Relocation Records

- (Same)

- RODATA Section (location counter: 0)

- (Same)

- TEXT Section (location counter: 0)

- (Same)

• Location counters reset to 0

39

---

---

---

---

---

---

---

---

### Assembler Pass 2

```

msg:
    .section ".rodata"
    .asciz "Hi\n"
    .section ".text"
    .globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl '$A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret

```

Assembler notes that the current section is RODATA

Assembler does nothing

Assembler places bytes in RODATA section, and increments location counter...

40

---

---

---

---

---

---

---

---

### Assembler Data Structures (9)

- Symbol Table
  - (Same)
- Relocation Records
  - (Same)
- RODATA Section (location counter 4)
  - Location counter incremented to 4
- TEXT Section (location counter: 0)
  - (Same)
  - RODATA section contains the bytes comprising the string

Offset	Contents (hex)	Explanation
0	48	ASCII code for 'H'
1	69	ASCII code for 'i'
2	0A	ASCII code for '\n'
3	00	ASCII code for null char

41

---

---

---

---

---

---

---

---

### Assembler Pass 2 (cont.)

```

    .section ".rodata"
msg:
    .asciz "Hi\n"
    .section ".text"
    .globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl '$A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret

```

Assembler notes that the current section is TEXT

Assembler updates Symbol Table...

42

---

---

---

---

---

---

---

---

## Assembler Data Structures (10)

- Symbol Table

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0
main	TEXT	0	global	1
skip	TEXT	26	local	2

• main is a global label

- Relocation Records

- (Same)
- RODATA Section (location counter: 4)
- (Same)
- TEXT Section (location counter: 0)
- (Same)

43

---

---

---

---

---

---

---

---

## Assembler Pass 2 (cont.)

```

.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cml $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
    
```

Assembler does nothing

Assembler generates machine language code in current (TEXT) section...

44

---

---

---

---

---

---

---

---

## Assembler Data Structures (11)

- Symbol Table

- (Same)
- Relocation Records
- (Same)
- RODATA Section (location counter: 4)
- (Same)
- TEXT Section (location counter: 1)

Offset	Contents	Explanation
0	55	pushl %ebp 01010101 This is a "pushl %ebp" instruction

45

---

---

---

---

---

---

---

---

## Assembler Pass 2 (cont.)

```
.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
```

Assembler generates machine language code in current (TEXT) section...

46

---

---

---

---

---

---

---

---

## Assembler Data Structures (12)

- Symbol Table
  - (Same)
- Relocation Records
  - (Same)
- RODATA Section (location counter: 4)
  - (Same)
- TEXT Section (location counter: 3)

Offset	Contents	Explanation
--	--	--
1-2	89 E5	movl %esp,%ebp 10001001 11 100 101 This is a "movl" instruction whose source operand is a register The M field designates a register The source register is ESP The destination register is EBP

47

---

---

---

---

---

---

---

---

## Assembler Pass 2 (cont.)

```
.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
```

Assembler generates machine language code in current (TEXT) section...

48

---

---

---

---

---

---

---

---

## Assembler Data Structures (12)

- Symbol Table
  - (Same)
- Relocation Records
  - (Same)
- RODATA Section (location counter: 4)
  - (Same)
- TEXT Section (location counter: 8)

- Assembler looks in Symbol Table to find offset of getchar
- getchar is not in Symbol Table
- Assembler cannot compute displacement that belongs at offset 4
- So...

Offset	Contents	Explanation
...	...	...
3-7	E8 ????????	call getchar 11101000 ??? This is a "call" instruction with a 4-byte immediate operand This the displacement

49

---

---

---

---

---

---

---

---

## Assembler Data Structures (13)

- Symbol Table
- Relocation Records
  - (Same)
- RODATA Section (location counter: 4)
  - (Same)
- TEXT Section (location counter: 8)
  - (Same)

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0
main	TEXT	0	global	1
skip	TEXT	26	local	2
getchar	?	?	global	3

- Assembler adds getchar to Symbol Table
- Then...

50

---

---

---

---

---

---

---

---

## Assembler Data Structures (14)

- Symbol Table
  - (Same)
- Relocation Records
- RODATA Section (location counter: 4)
  - (Same)
- TEXT Section (location counter: 8)
  - (Same)

Section	Offset	Rel Type	Seq#
TEXT	4	displacement	3

- Assembler generates a relocation record, thus asking linker to patch code

*Dear Linker,  
Please patch the TEXT section at offset 4. Do a "displacement" type of patch. The patch is with respect to the label whose seq number is 3 (i.e. getchar).  
Sincerely,  
Assembler*

51

---

---

---

---

---

---

---

---

## Assembler Pass 2 (cont.)

```

.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
    
```

Assembler generates machine language code in current (TEXT) section...

---

---

---

---

---

## Assembler Data Structures (15)

- Symbol Table
  - (Same)
- Relocation Records
  - (Same)
- RODATA Section (location counter: 4)
  - (Same)
- TEXT Section (location counter: 11)

Offset	Contents	Explanation
...	...	...
\$-10	83 F8 41	cmpl \$'A', %eax 10000011 11 111 000 01000001 This is some "l" instruction that has a 1 byte immediate operand The M field designates a register This is a "cmpl" instruction The destination register is EAX The immediate operand is 'A'

53

---

---

---

---

---

---

---

---

## Assembler Pass 2 (cont.)

```

.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
    
```

Assembler generates machine language code in current (TEXT) section...

54

---

---

---

---

---

---

---

---

## Assembler Data Structures (17)

- Symbol Table
  - (Same)
- Relocation Records

Section	Offset	Rel Type	Seq#
...	...	...	...
TEXT	14	absolute	0

• Assembler generates a relocation record, thus asking linker to patch code

- RODATA Section (location counter: 4)
  - (Same)
- TEXT Section (location counter: 18)
  - (Same)

*Dear Linker,  
Please patch the TEXT section at offset 14. Do an "absolute" type of patch. The patch is with respect to the label whose seq number is 0 (i.e. msg).  
Sincerely,  
Assembler*

58

---

---

---

---

---

---

---

---

## Assembler Pass 2 (cont.)

```

.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cml $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
    
```

Assembler generates machine language code in current (TEXT) section...

59

---

---

---

---

---

---

---

---

## Assembler Data Structures (18)

- Symbol Table
  - (Same)
- Relocation Records
  - (Same)
- RODATA Section (location counter: 4)
  - (Same)
- TEXT Section (location counter: 23)

• Assembler looks in Symbol Table to find offset of printf  
• printf is not in Symbol Table  
• Assembler cannot compute displacement that belongs at offset 19  
• So...

Offset	Contents	Explanation
...	...	...
18-22	E8 ????????	call printf 11101000 ????????????????????????????????????? This is a "call" instruction with a 4-byte immediate operand This the displacement

60

---

---

---

---

---

---

---

---

## Assembler Data Structures (19)

- Symbol Table

Label	Section	Offset	Local?	Seq#
msg	RODATA	0	local	0
main	TEXT	0	global	1
skip	TEXT	26	local	2
getchar	?	?	global	3
printf	?	?	global	4

- Relocation Records
  - (Same)
- RODATA Section (location counter: 4)
  - (Same)
- TEXT Section (location counter: 23)
  - (Same)

• Assembler adds printf to Symbol Table  
• Then...

61

---

---

---

---

---

---

---

---

## Assembler Data Structures (20)

- Symbol Table
  - (Same)
- Relocation Records

Section	Offset	Rel Type	Seq#
...	...	...	...
TEXT	19	displacement	4

- RODATA Section (location counter: 4)
  - (Same)
- TEXT Section (location counter: 8)
  - (Same)

Dear Linker,  
Please patch the TEXT section at offset 19. Do a "displacement" type of patch. The patch is with respect to the label whose seq number is 4 (i.e. printf).  
Sincerely,  
Assembler

62

---

---

---

---

---

---

---

---

## Assembler Pass 2 (cont.)

```

.section ".rodata"
msg:
.asciz "Hi\n"
.section ".text"
.globl main
main:
    pushl %ebp
    movl %esp, %ebp
    call getchar
    cmpl $'A', %eax
    jne skip
    pushl $msg
    call printf
    addl $4, %esp
skip:
    movl $0, %eax
    movl %ebp, %esp
    popl %ebp
    ret
    
```

---

---

---

---

---

---

---

## Assembler Data Structures (21)

- Symbol Table, Relocation Records, RODATA Section
  - (Same)
- TEXT Section (location counter: 31)

Offset	Contents	Explanation
--	--	--
23-25	83 C4 04	addl \$4,%esp 10000011 11 000 100 00000100 This is some "l" instruction that has a 1 byte immediate operand The M field designates a register This is an "add" instruction The destination register is ESP The immediate operand is 4
26-30	B8 00000000	movl \$0,%eax 10111000 00000000000000000000000000000000 This is an instruction of the form "movl 4-byte-immediate, %eax" The immediate operand is 0

64

---

---

---

---

---

---

---

---

---

---

## Assembler Data Structures (22)

- Symbol Table, Relocation Records, RODATA Section
  - (Same)
- TEXT Section (location counter: 35)

Offset	Contents	Explanation
--	--	--
31-32	89 EC	movl %ebp,%esp 10001001 11 101 100 This is a "movl" instruction whose source operand is a register The M field designates a register The source register is EBP The destination register is ESP
33	5D	popl %ebp 01011101 This is a "popl %ebp" instruction
34	C3	ret 11000011 This is a "ret" instruction

65

---

---

---

---

---

---

---

---

---

---

## From Assembler to Linker

- Assembler writes its data structures to .o file
- Linker:
  - Reads .o file
  - Works in two phases: resolution and relocation

66

---

---

---

---

---

---

---

---

---

---

## Linker Resolution

- Resolution
  - Linker resolves references
- For this program, linker:
  - Notes that Symbol Table contains undefined labels
    - getchar and printf
  - Fetches, from libc.a, machine language code defining getchar and printf
  - Adds that code to TEXT section
    - (May add code to other sections too)
  - Updates Symbol Table to note offsets of getchar and printf
  - Adds column to Symbol Table to note addresses of all labels

67

---

---

---

---

---

---

---

---

## Linker Relocation

- Relocation
  - Linker patches ("relocates") code
  - Linker traverses relocation records, patching code as specified
- For this program

Section	Offset	Rel Type	Seq#
TEXT	4	displacement	3
TEXT	14	absolute	0
TEXT	19	displacement	4

- Linker looks up offset of getchar
- Linker computes:  
[offset of getchar] - 8
- Linker places difference in TEXT section at offset 4

68

---

---

---

---

---

---

---

---

## Linker Relocation (cont.)

- For this program

Section	Offset	Rel Type	Seq#
TEXT	4	displacement	3
TEXT	14	absolute	0
TEXT	19	displacement	4

- Linker looks up addr of msg
- Linker places addr in TEXT section at offset 14

69

---

---

---

---

---

---

---

---

## Linker Relocation (cont.)

- For this program

Section	Offset	Rel Type	Seq#
TEXT	4	displacement	3
TEXT	14	absolute	0
TEXT	19	displacement	4

- Linker looks up offset of printf
- Linker computes:  
[offset of printf] - 23
- Linker places difference in TEXT  
section at offset 19

70

---

---

---

---

---

---

---

---

## Linker Finishes

- Linker writes resulting TEXT, RODATA, DATA, BSS  
sections to executable binary file

71

---

---

---

---

---

---

---

---

## ELF: Executable and Linking Format

- Unix format of object and executable files
  - Output by the assembler
  - Input and output of linker

72

---

---

---

---

---

---

---

---

## Conclusions

- **Assembler:** reads assembly language file
  - **Pass 1:** Generates Symbol Table
    - Contains info about labels
  - **Pass 2:** Uses Symbol Table to generate code
    - TEXT, RODATA, DATA, BSS sections
    - Relocation Records
  - Writes object file (ELF)
- **Linker:** reads object files
  - **Resolution:** Resolves references to make Symbol Table complete
  - **Relocation:** Uses Symbol Table and Relocation Records to patch code
  - Writes executable binary file (ELF)

## Appendix: Generating Machine Lang

- Hint for Buffer Overrun assignment...
- Given an assembly language instruction, how can you find the machine language equivalent?
- **Option 1:** Consult IA-32 reference manuals
  - See course Web pages for links to the manuals

74

---

---

---

---

---

---

---

---

## Appendix: Generating Machine Lang

- **Option 2:**
  - Compose an assembly language program that contains the given assembly language instruction
  - Then use gdb...
