any program you might want to write

# 1.4 Arrays

Introduction to Programming in Java: An Interdisciplinary Approach Robert Sedgewick and Kevin Wayne Copyright © 2002–2010 2/6/11 12:33 PM

## Arrays

This lecture. Store and manipulate huge quantities of data.

Array. Indexed sequence of values of the same type.

#### Examples.

- 52 playing cards in a deck.
- 5 thousand undergrads at Princeton.
- 1 million characters in a book.
- 10 million audio samples in an MP3 file.
- 4 billion nucleotides in a DNA strand.
- 73 billion Google queries per year.
- 50 trillion cells in the human body.
- $6.02 \times 10^{23}$  particles in a mole.

# objects functions and modules graphics, sound, and image I/O arrays conditionals and loops Math text I/O primitive data types assignment statements

Many Variables of the Same Type

Goal. 10 variables of the same type.

```
// tedious and error-prone
double a0, a1, a2, a3, a4, a5, a6, a7, a8, a9;
a0 = 0.0;
a1 = 0.0;
a2 = 0.0;
a3 = 0.0;
a4 = 0.0;
a5 = 0.0;
a6 = 0.0;
a7 = 0.0;
a8 = 0.0;
a9 = 0.0;
...
a4 = 3.0;
...
double x = a4 + a8;
```

#### Goal. 10 variables of the same type.

#### Arrays in Java

#### Java has special language support for arrays.

- To make an array: declare, create, and initialize it.
- To access element i of array named a, use a[i].
- Array indices start at 0.

#### Compact alternative.

- Declare, create, and initialize in one statement.
- Default initialization: all numbers automatically set to zero.

Goal. 1 million variables of the same type.

```
// scales to handle large arrays
double[] a = new double[1000000];
...
a[123456] = 3.0;
declares, creates, and initializes
[stay tuned for details]
...
double x = a[123456] + a[987654];
```

#### Vector Dot Product

Dot product. Given two vectors  $\mathbf{x}[]$  and  $\mathbf{y}[]$  of length  $\mathbf{n}$ , their dot product is the sum of the products of their corresponding components.

```
double[] x = { 0.3, 0.6, 0.1 };
double[] y = { 0.5, 0.1, 0.4 };
int N = x.length;
double sum = 0.0;
for (int i = 0; i < N; i++) {
    sum = sum + x[i]*y[i];
}</pre>
```

```
i x[i] y[i] x[i]*y[i] sum

0
0 .30 .50 .15 .15
1 .60 .10 .06 .21
2 .10 .40 .04 .25
.25
```

## Array-Processing Examples

create an array with random values	<pre>double[] a = new double[N]; for (int i = 0; i &lt; N; i++)    a[i] = Math.random();</pre>	
print the array values, one per line	<pre>for (int i = 0; i &lt; N; i++) System.out.println(a[i]);</pre>	
find the maximum of the array values	<pre>double max = Double.NEGATIVE_INFINITY; for (int i = 0; i &lt; N; i++)   if (a[i] &gt; max) max = a[i];</pre>	
compute the average of the array values	<pre>double sum = 0.0; for (int i = 0; i &lt; N; i++)    sum += a[i]; double average = sum / N;</pre>	
copy to another array	<pre>double[] b = new double[N]; for (int i = 0; i &lt; N; i++)    b[i] = a[i];</pre>	
reverse the elements within an array	<pre>for (int i = 0; i &lt; N/2; i++) {    double temp = b[i];    b[i] = b[N-1-i];    b[N-i-1] = temp; }</pre>	

# Setting Array Values at Compile Time

#### Ex. Print a random card.

```
String[] rank = {
    "2", "3", "4", "5", "6", "7", "8", "9",
    "10", "Jack", "Queen", "King", "Ace"
};

String[] suit = {
    "Clubs", "Diamonds", "Hearts", "Spades"
};

int i = (int) (Math.random() * 13); // between 0 and 12
int j = (int) (Math.random() * 4); // between 0 and 3

System.out.println(rank[i] + " of " + suit[j]);
```

# Shuffling a Deck

# Setting Array Values at Run Time

Ex. Create a deck of playing cards and print them out.

```
String[] deck = new String[52];
for (int i = 0; i < 13; i++)
    for (int j = 0; j < 4; j++)
        deck[4*i + j] = rank[i] + " of " + suit[j];

for (int i = 0; i < 52; i++)
    System.out.println(deck[i]);</pre>
```

Q. In what order does it output them?

```
two of clubs
two of diamonds
two of hearts
two of spades
three of clubs
```

### Shuffling

Goal. Given an array, rearrange its elements in random order.

#### Shuffling algorithm.

- In iteration i, pick random card from deck[i] through deck[N-1],
   with each card equally likely.
- Exchange it with deck[i].

```
int N = deck.length;
for (int i = 0; i < N; i++) {
   int r = i + (int) (Math.random() * (N-i));
   String t = deck[r];
   deck[r] = deck[i];
   deck[i] = t;
}</pre>
```

Shuffling a Deck of Cards

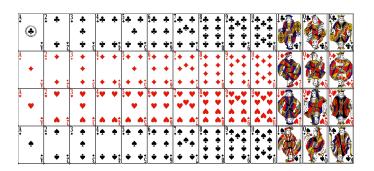

```
% java Deck
5 of Clubs
Jack of Hearts
9 of Spades
10 of Spades
9 of Clubs
7 of Spades
6 of Diamonds
7 of Hearts
7 of Clubs
4 of Spades
Oueen of Diamonds
10 of Hearts
5 of Diamonds
Jack of Clubs
Ace of Hearts
5 of Spades
```

```
% java Deck
10 of Diamonds
King of Spades
2 of Spades
3 of Clubs
4 of Spades
Queen of Clubs
2 of Hearts
7 of Diamonds
6 of Spades
Queen of Spades
3 of Spades
Jack of Diamonds
6 of Diamonds
8 of Spades
9 of Diamonds
. . .
10 of Spades
```

Shuffling a Deck of Cards: Putting Everything Together

```
public class Deck {
   public static void main(String[] args) {
      String[] suit = { "Clubs", "Diamonds", "Hearts", "Spades" };
      String[] rank = { "2", "3", "4", "5", "6", "7", "8", "9",
                         "10", "Jack", "Queen", "King", "Ace"
      int SUITS = suit.length;
      int RANKS = rank.length;
      int N = SUITS * RANKS;
                                           avoid "hardwired" constants
                                                     build the deck
      String[] deck = new String[N];
      for (int i = 0; i < RANKS; i++)</pre>
         for (int j = 0; j < SUITS; j++)
            deck[SUITS*i + j] = rank[i] + " of " + suit[j];
      for (int i = 0; i < N; i++) {</pre>
                                                          shuffle
        int r = i + (int) (Math.random() * (N-i));
        String t = deck[r];
         deck[r] = deck[i];
         deck[i] = t;
                                                 print shuffled deck
      for (int i = 0; i < N; i++)
         System.out.println(deck[i]);
```

# Coupon Collector

#### Coupon Collector Problem

Coupon collector problem. Given  ${\tt N}$  different card types, how many do you have to collect before you have (at least) one of each type?

Simulation algorithm. Repeatedly choose an integer  $\tt i$  between 0 and  $\tt N-1$ . Stop when we have at least one card of every type.

- Q. How to check if we've seen a card of type i?
- A. Maintain a boolean array so that found[i] is true if we've already collected a card of type i.

Coupon Collector: Debugging

Debugging. Add code to print contents of all variables.

val -	found	- valcnt	cardcnt
	0 1 2 3 4 5		
	FFFFFF	0	0
2	FFTFFF	1	1
0	TFTFFF	2	2
4	T	3	3
0	TFTFTF	3	4
1	T <b>T</b> T F T F	4	5
2	TTTFTF	4	6
5	$\top\ \top\ \top\ \top\ F\ \top\ \boldsymbol{T}$	5	7
0	TTTFTT	5	8
1	TTTFTT	5	9
3	$\top \ \top \ \top \ T \ \top \ T$	6	10

Challenge. Debugging with arrays requires tracing many variables.

#### Coupon Collector: Java Implementation

```
public class CouponCollector {
  public static void main(String[] args) {
      int N = Integer.parseInt(args[0]);
      int cardcnt = 0; // number of cards collected
      int valcnt = 0;
                         // number of distinct cards
      // do simulation
      boolean[] found = new boolean[N];
      while (valcnt < N) {</pre>
         int val = (int) (Math.random() * N);
         cardcnt++;
                                            type of next card
         if (!found[val]) {
                                            (between 0 and N-1)
            valcnt++;
            found[val] = true;
      // all N distinct cards found
      System.out.println(cardcnt);
```

Coupon Collector: Mathematical Context

Coupon collector problem. Given N different possible cards, how many do you have to collect before you have (at least) one of each type?

```
Fact. About N (1 + 1/2 + 1/3 + ... + 1/N) ~ N In N.

see ORF 245 or COS 340
```

Ex. N = 30 baseball teams. Expect to wait  $\approx$  120 years before all teams win a World Series.

### Coupon Collector: Scientific Context

- Q. Given a sequence from nature, does it have same characteristics as a random sequence?
- A. No easy answer many tests have been developed.

Coupon collector test. Compare number of elements that need to be examined before all values are found against the corresponding answer for a random sequence.

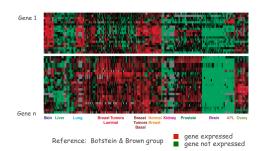

# Two-Dimensional Arrays

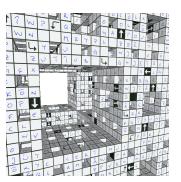

#### Two-dimensional arrays.

- Table of data for each experiment and outcome.
- Table of grades for each student and assignments.
- Table of grayscale values for each pixel in a 2D image.

Mathematical abstraction. Matrix. Java abstraction. 2D array.

# Multidimensional Arrays

Two-Dimensional Arrays in Java

Array access. Use a[i][j] to access element in row i and column j.

Zero-based indexing. Row and column indices start at 0.

```
int M = 10;
int N = 3;
double[][] a = new double[M][N];
for (int i = 0; i < M; i++) {
    for (int j = 0; j < N; j++) {
        a[i][j] = 0.0;
    }
}</pre>
```

A~10-by-3 array

24

#### Setting 2D Array Values at Compile Time

Initialize 2D array by listing values.

```
double[][] p = {
    { .02, .92, .02, .02, .02 },
    { .02, .02, .32, .32, .32 },
    { .02, .02, .02, .92, .02 },
    { .92, .02, .02, .02, .02 },
    { .47, .02, .47, .02, .02 },
};
```

# Matrix Multiplication

Matrix multiplication. Given two N-by-N matrices a and b, define c to be the N-by-N matrix where c[i][j] is the dot product of the i<sup>th</sup> row of a[j[j] and the j<sup>th</sup> column of b[j[j].

```
a[][]
                         all values initialized to 0
                                                           .70 .20 .10
                                                           .30 .60 .10 \leftarrow row 1
                                                           .50 .10 .40
double[][] c = new double[N][N];
                                                                 column 2
for (int i = 0; i < N; i++)</pre>
                                                        b[][]
   for (int j = 0; j < N; j++)
                                                           .80 .30 .50
       for (int k = 0; k < N; k++)
                                                           .10 .40 .10
           c[i][j] += a[i][k] * b[k][j];
                                                           .10 .30 .40
                                                                  c[1][2] = .3 *.5
                                                                           + .6 *.1
                                                        c[][]
                          dot product of row i of a[][]
                                                                           + .1 *.4
                         and column j of b[][]
                                                           .59 .32 .41
                                                                          =_.25
                                                           .31 .36 .25
                                                           .45 .31 .42
```

#### Matrix Addition

Matrix addition. Given two N-by-N matrices a and b, define c to be the N-by-N matrix where c[i][j] is the sum a[i][j] + b[i][j].

```
double[][] c = new double[N][N];
for (int i = 0; i < N; i++)
  for (int j = 0; j < N; j++)
    c[i][j] = a[i][j] + b[i][j];</pre>
c[][]
1.5 .50 .60
.40 1.0 .20
.60 .40 .80
```

#### Array Challenge 2

- Q. How many scalar multiplications multiply two N-by-N matrices?
- **A**. N

26

- $B. N^2$
- C. N<sup>3</sup>
- D. N<sup>4</sup>

27

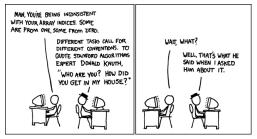

```
double[][] c = new double[N][N];
for (int i = 0; i < N; i++)
  for (int j = 0; j < N; j++)
    for (int k = 0; k < N; k++)
        c[i][j] += a[i][k] * b[k][j];</pre>
```

## Summary

#### Arrays.

- Organized way to store huge quantities of data.
- Almost as easy to use as primitive types.
- Can directly access an element given its index.

Ahead. Reading in large quantities of data from a file into an array.

http://imgs.xkcd.com/comics/donald\_knuth.png
