

## 6.1 Combinational Circuits

---

George Boole (1815 - 1864)

Claude Shannon (1916 - 2001)

# Signals and Wires

## Digital signals

- Binary (or "logical") values: 1 or 0, on or off, high or low voltage

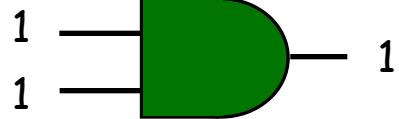

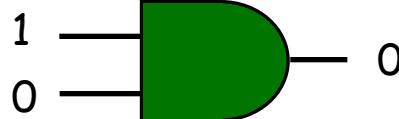

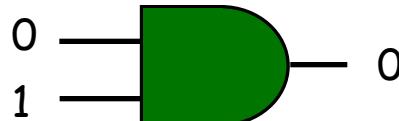

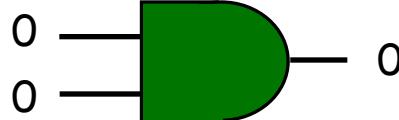

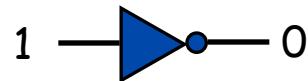

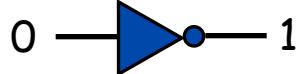

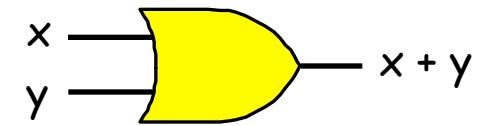

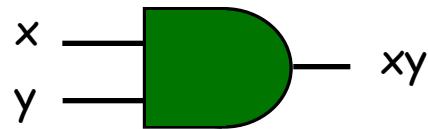

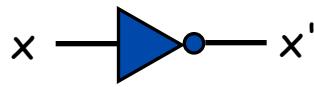

## Wires.

- Propagate digital signals from place to place.
- Signals "flow" from left to right.
  - A drawing convention, sometimes violated
  - Actually: flow from producer to consumer(s) of signal

# Logic Gates

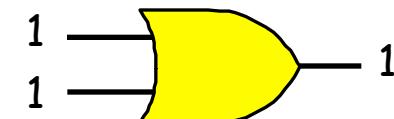

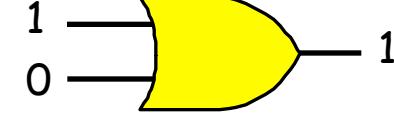

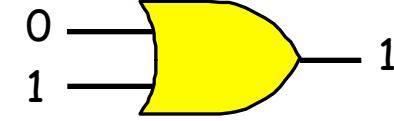

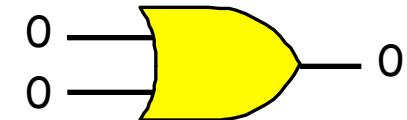

## Logical gates.

- Fundamental building blocks.

NOT

AND

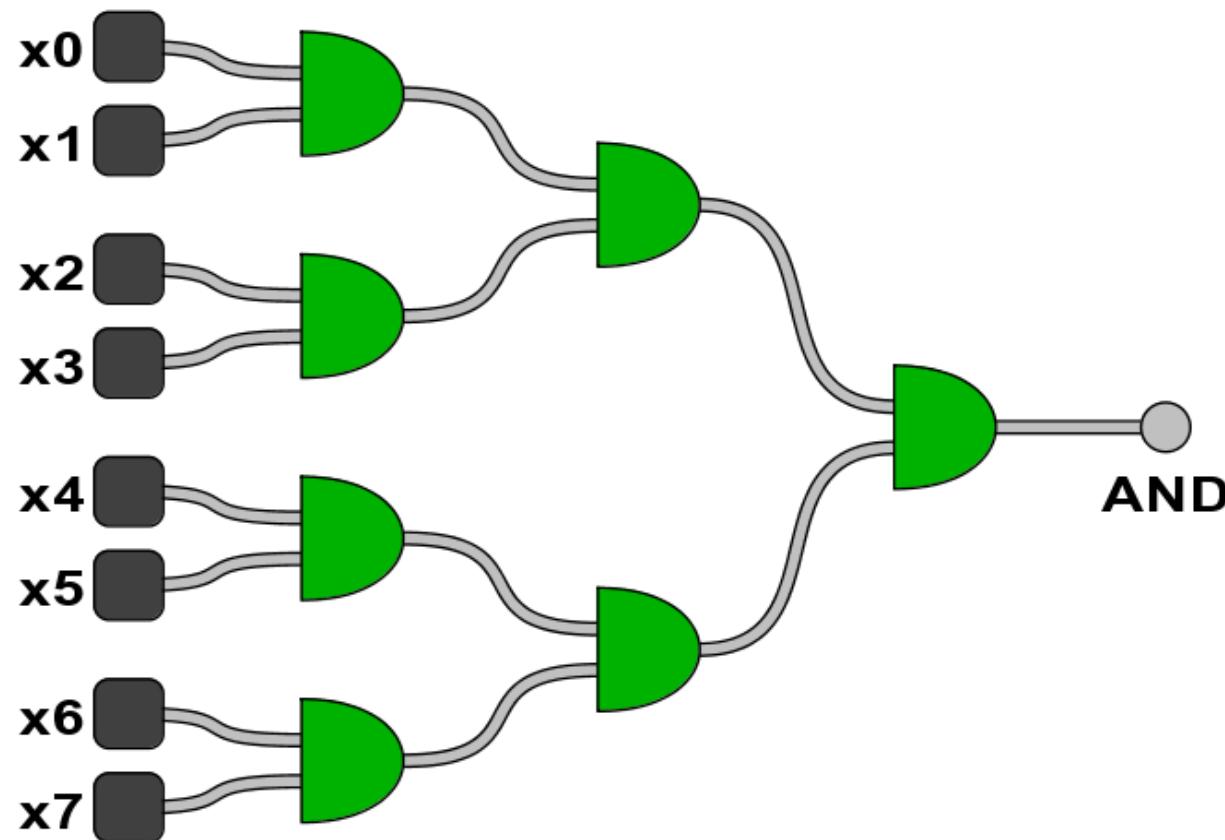

OR

## Multiway AND Gates

$\text{AND}(x_0, x_1, x_2, x_3, x_4, x_5, x_6, x_7)$ .

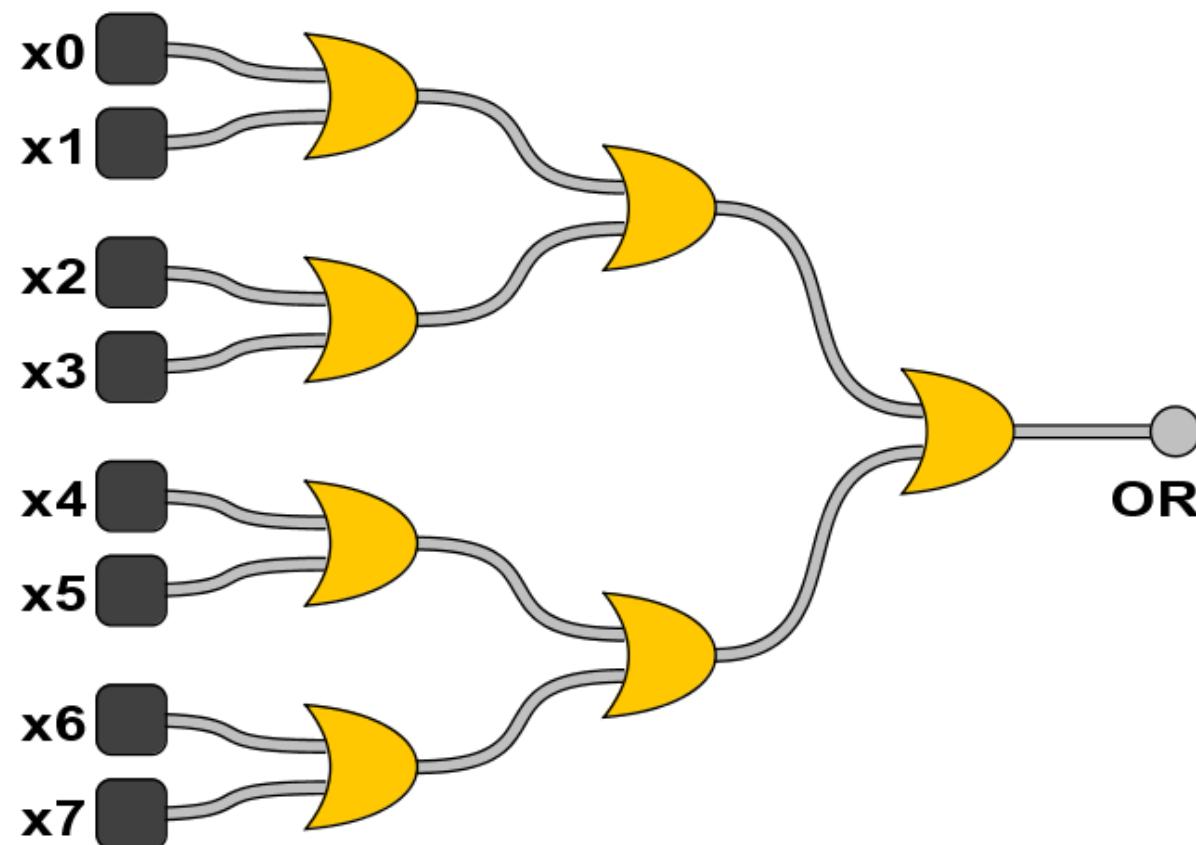

- 1 if all inputs are 1.
- 0 otherwise.

## Multiway OR Gates

$\text{OR}(x_0, x_1, x_2, x_3, x_4, x_5, x_6, x_7)$ .

- 1 if at least one input is 1.
- 0 otherwise.

# Boolean Algebra

## History.

- Developed by Boole to solve mathematical logic problems (1847).
- Shannon master's thesis applied it to digital circuits (1937).

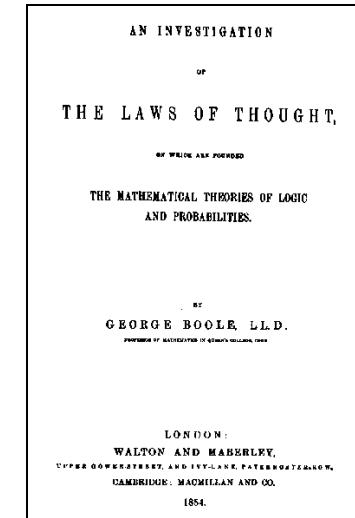

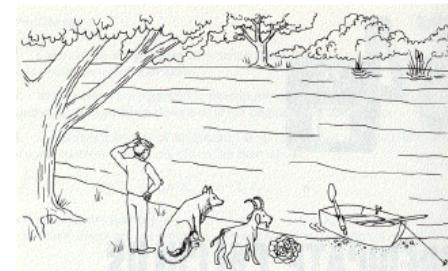

"possibly the most important, and also the most famous, master's thesis of the [20th] century" --Howard Gardner

## Basics.

- Boolean variable: value is 0 or 1.
- Boolean function: function whose inputs and outputs are 0, 1.

## Relationship to circuits.

- Boolean variables: signals.
- Boolean functions: circuits.

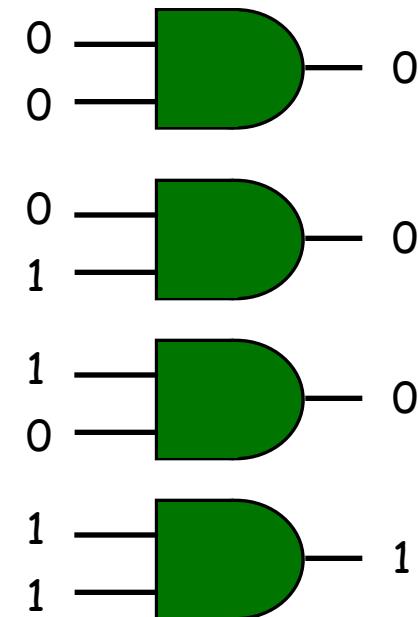

## Truth Table

Truth table.

- Systematic method to describe Boolean function.
- One row for each possible input combination.
- $N$  inputs  $\Rightarrow 2^N$  rows.

AND Truth Table		
x	y	AND(x, y)
0	0	0
0	1	0
1	0	0
1	1	1

AND

## Truth Table for Functions of 2 Variables

Truth table.

- 16 Boolean functions of 2 variables.
  - every 4-bit value represents one

Truth Table for All Boolean Functions of 2 Variables										
x	y	ZERO	AND		x		y	XOR	OR	
0	0	0	0	0	0	0	0	0	0	
0	1	0	0	0	0	1	1	1	1	
1	0	0	0	1	1	0	0	1	1	
1	1	0	1	0	1	0	1	0	1	

Truth Table for All Boolean Functions of 2 Variables										
x	y	NOR	EQ	y'		x'		NAND	ONE	
0	0	1	1	1	1	1	1	1	1	
0	1	0	0	0	0	1	1	1	1	
1	0	0	0	1	1	0	0	1	1	
1	1	0	1	0	1	0	1	0	1	

## Truth Table for Functions of 3 Variables

Truth table.

- 16 Boolean functions of 2 variables.
  - every 4-bit value represents one
- 256 Boolean functions of 3 variables.
  - every 8-bit value represents one
- $2^{(2^N)}$  Boolean functions of N variables!

Some Functions of 3 Variables						
x	y	z	AND	OR	MAJ	ODD
0	0	0	0	0	0	0
0	0	1	0	1	0	1
0	1	0	0	1	0	1
0	1	1	0	1	1	0
1	0	0	0	1	0	1
1	0	1	0	1	1	0
1	1	0	0	1	1	0
1	1	1	1	1	1	1

# Universality of AND, OR, NOT

Any Boolean function can be expressed using AND, OR, NOT.

- "Universal"
- Example:  $\text{XOR}(x,y) = xy' + x'y$

Expressing XOR Using AND, OR, NOT							
x	y	$x'$	$y'$	$x'y$	$xy'$	$x'y + xy'$	XOR
0	0	1	1	0	0	0	0
0	1	1	0	1	0	1	1
1	0	0	1	0	1	1	1
1	1	0	0	0	0	0	0

Notation	Meaning
$x'$	NOT x
$xy$	$x$ AND $y$
$x + y$	$x$ OR $y$

Exercise. Show {AND, NOT}, {OR, NOT}, {NAND}, {AND, XOR} are universal.

Hint. Use DeMorgan's Law:  $(xy)' = (x' + y')$  and  $(x + y)' = (x'y')$

## Sum-of-Products

Any Boolean function can be expressed using AND, OR, NOT.

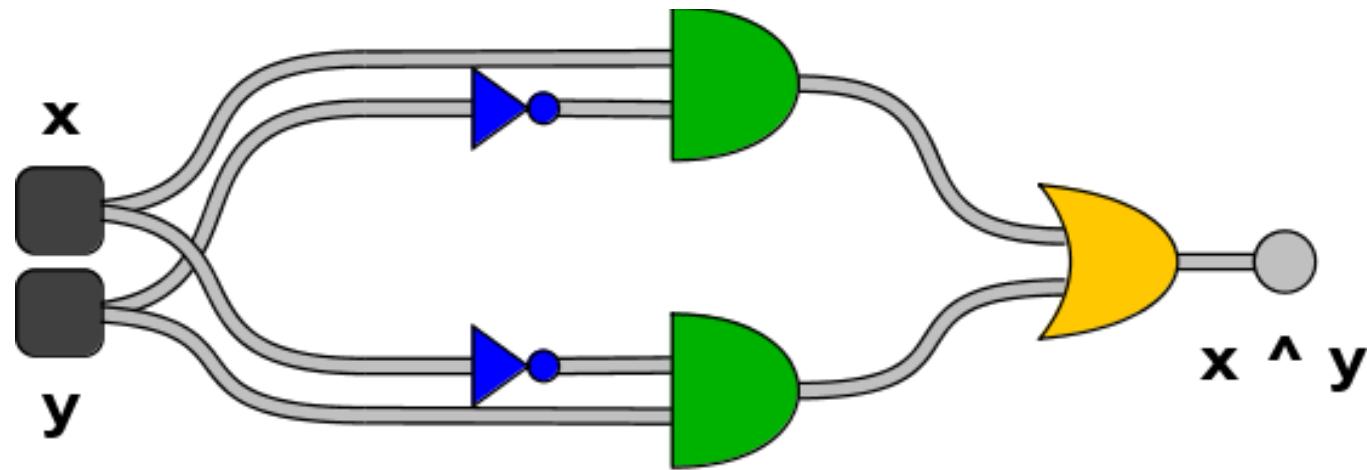

- Sum-of-products is systematic procedure.
  - form AND term for each 1 in truth table of Boolean function
  - OR terms together

Expressing MAJ Using Sum-of-Products								
x	y	z	MAJ	$x'yz$	$xy'z$	$xyz'$	$xyz$	$x'yz + xy'z + xyz' + xyz$
0	0	0	0	0	0	0	0	0
0	0	1	0	0	0	0	0	0
0	1	0	0	0	0	0	0	0
0	1	1	1	1	0	0	0	1
1	0	0	0	0	0	0	0	0
1	0	1	1	0	1	0	0	1
1	1	0	1	0	0	1	0	1
1	1	1	1	0	0	0	1	1

## Translate Boolean Formula to Boolean Circuit

Use sum-of-products form.

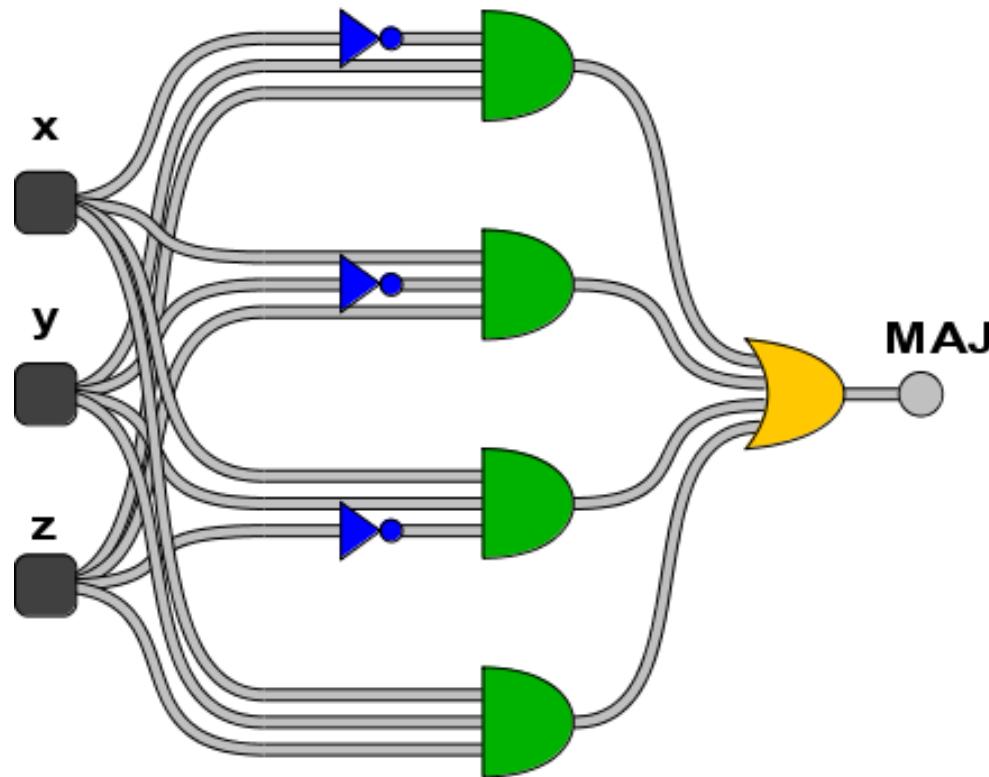

- $\text{XOR}(x, y) = xy' + x'y.$

## Translate Boolean Formula to Boolean Circuit

Use sum-of-products form.

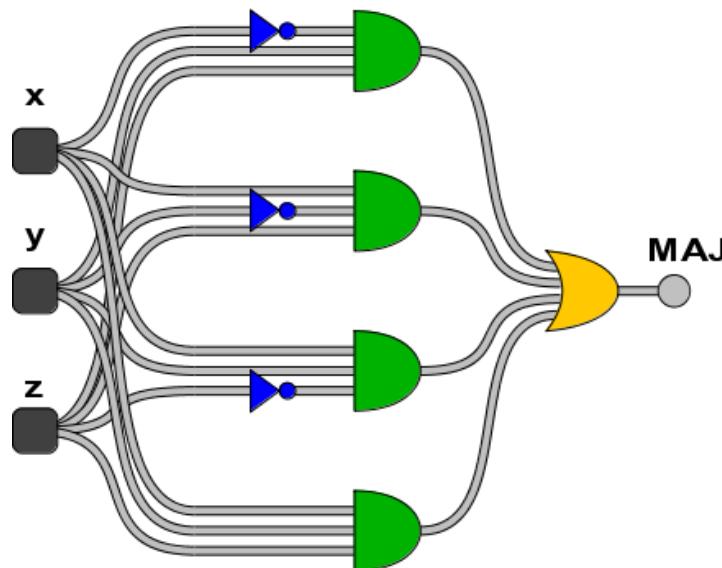

- $\text{MAJ}(x, y, z) = x'y'z + xy'z + xyz' + xyz.$

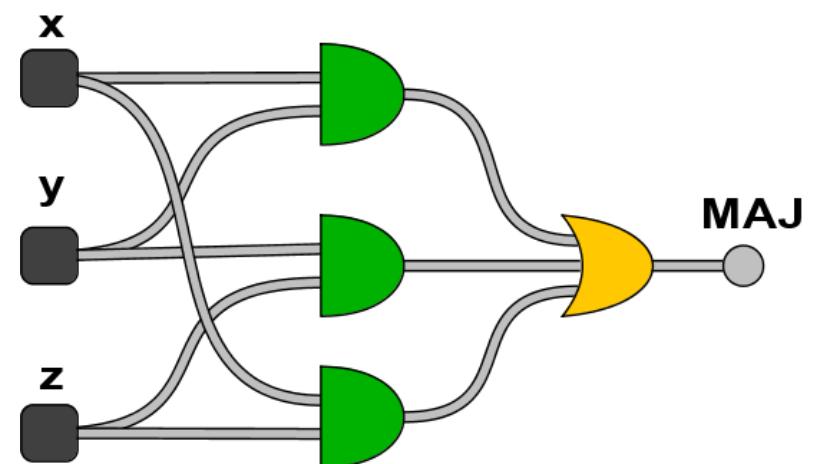

## Simplification Using Boolean Algebra

Many possible circuits for each Boolean function.

- Sum-of-products not necessarily optimal in:
  - number of gates (space)
  - depth of circuit (time)
- $\text{MAJ}(x, y, z) = x'y'z + xy'z + xyz' + xyz = xy + yz + xz.$

size = 8, depth = 3

size = 4, depth = 2

# Expressing a Boolean Function Using AND, OR, NOT

## Ingredients.

- AND gates.
- OR gates.
- NOT gates.
- Wire.

## Instructions.

- Step 1: represent input and output signals with Boolean variables.
- Step 2: construct truth table to carry out computation.
- Step 3: derive (simplified) Boolean expression using sum-of products.
- Step 4: transform Boolean expression into circuit.

## ODD Parity Circuit

$\text{ODD}(x, y, z)$ .

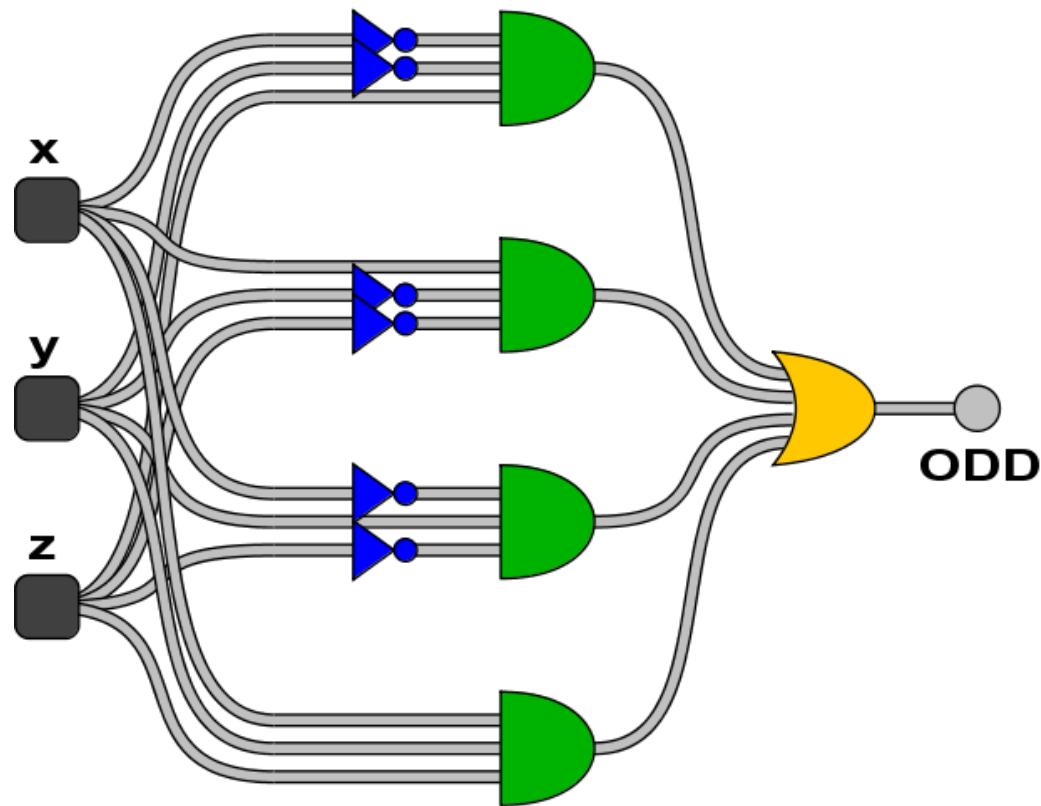

- 1 if odd number of inputs are 1.
- 0 otherwise.

Expressing ODD Using Sum-of-Products								
x	y	z	ODD	$x'y'z$	$x'yz'$	$xy'z'$	$xyz$	$x'y'z + x'yz' + xy'z' + xyz$
0	0	0	0	0	0	0	0	0
0	0	1	1	1	0	0	0	1
0	1	0	1	0	1	0	0	1
0	1	1	0	0	0	0	0	0
1	0	0	1	0	0	1	0	1
1	0	1	0	0	0	0	0	0
1	1	0	0	0	0	0	0	0
1	1	1	1	0	0	0	1	1

## ODD Parity Circuit

$\text{ODD}(x, y, z)$ .

- 1 if odd number of inputs are 1.
- 0 otherwise.

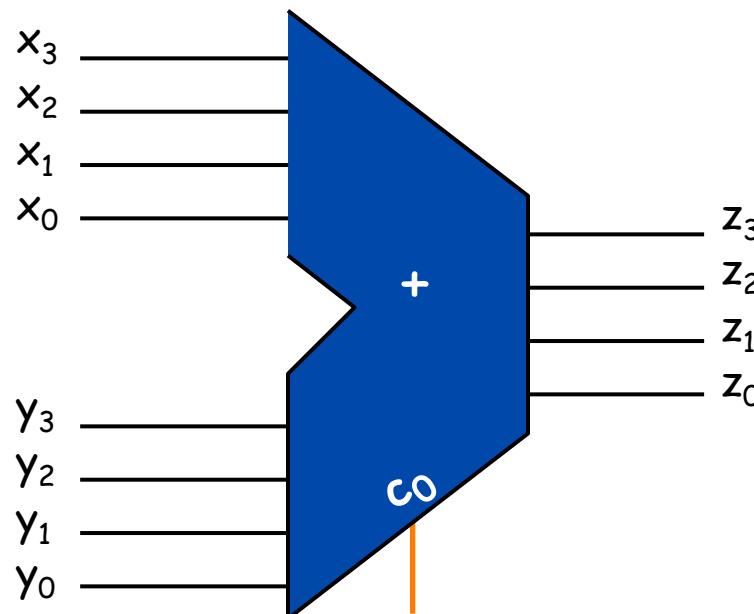

# Let's Make an Adder Circuit

Goal:  $x + y = z$  for 4-bit integers.

- We build 4-bit adder: 9 inputs, 4 outputs.
- Same idea scales to 128-bit adder.
- Key computer component.

Step 1.

- Represent input and output in binary.

$$\begin{array}{r}
 1 & 1 & 1 & 0 \\
 2 & 4 & 8 & 7 \\
 + & 3 & 5 & 7 & 9 \\
 \hline
 6 & 0 & 6 & 6
 \end{array}$$

$$\begin{array}{r}
 1 & 1 & 0 & 0 \\
 0 & 0 & 1 & 0 \\
 + & 0 & 1 & 1 & 1 \\
 \hline
 1 & 0 & 0 & 1
 \end{array}$$

$$\begin{array}{r}
 x_3 & x_2 & x_1 & x_0 \\
 + & y_3 & y_2 & y_1 & y_0 \\
 \hline
 z_3 & z_2 & z_1 & z_0
 \end{array}$$

## Let's Make an Adder Circuit

Goal:  $x + y = z$  for 4-bit integers.

### Step 2. (first attempt)

- Build truth table.
- Why is this a bad idea?
  - 128-bit adder:  $2^{256+1}$  rows > # electrons in universe!

$c_0$	$x_3$	$x_2$	$x_1$	$x_0$	$y_3$	$y_2$	$y_1$	$y_0$	$z_3$	$z_2$	$z_1$	$z_0$
0	0	0	0	0	0	0	0	0	0	0	0	0

4-Bit Adder Truth Table													
$c_0$	$x_3$	$x_2$	$x_1$	$x_0$	$y_3$	$y_2$	$y_1$	$y_0$	$z_3$	$z_2$	$z_1$	$z_0$	
0	0	0	0	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1	0	0	0	0	1
0	0	0	0	0	0	0	1	0	0	0	1	0	0
0	0	0	0	0	0	0	1	1	0	0	1	1	1
0	0	0	0	0	0	1	0	0	0	1	0	0	0
0	0	0	0	0	0	1	0	1	0	1	0	1	1
.	.	.	.	.	.	.	.	.	.	.	.	.	.
1	1	1	1	1	1	1	1	1	1	1	1	1	1

$2^{8+1} = 512$  rows!

# Let's Make an Adder Circuit

Goal:  $x + y = z$  for 4-bit integers.

Step 2. (do one bit at a time)

- Build truth table for carry bit.
- Build truth table for summand bit.

$c_3$	$c_2$	$c_1$	$c_0 = 0$
	$x_3$	$x_2$	$x_1 \quad x_0$
+	$y_3$	$y_2$	$y_1 \quad y_0$
	$z_3$	$z_2$	$z_1 \quad z_0$

Carry Bit			
$x_i$	$y_i$	$c_i$	$c_{i+1}$
0	0	0	0
0	0	1	0
0	1	0	0
0	1	1	1
1	0	0	0
1	0	1	1
1	1	0	1
1	1	1	1

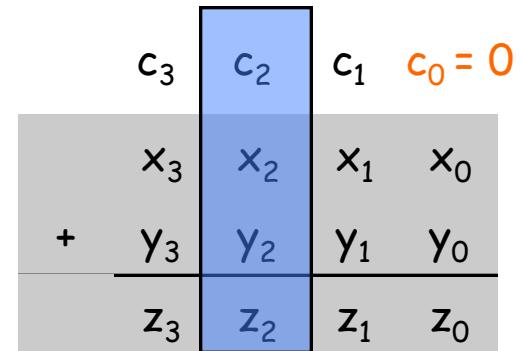

Summand Bit			
$x_i$	$y_i$	$c_i$	$z_i$
0	0	0	0
0	0	1	1
0	1	0	1
0	1	1	0
1	0	0	1
1	0	1	0
1	1	0	0
1	1	1	1

# Let's Make an Adder Circuit

Goal:  $x + y = z$  for 4-bit integers.

Step 3.

- Derive (simplified) Boolean expression.

Carry Bit				
$x_i$	$y_i$	$c_i$	$c_{i+1}$	MAJ
0	0	0	0	0
0	0	1	0	0
0	1	0	0	0
0	1	1	1	1
1	0	0	0	0
1	0	1	1	1
1	1	0	1	1
1	1	1	1	1

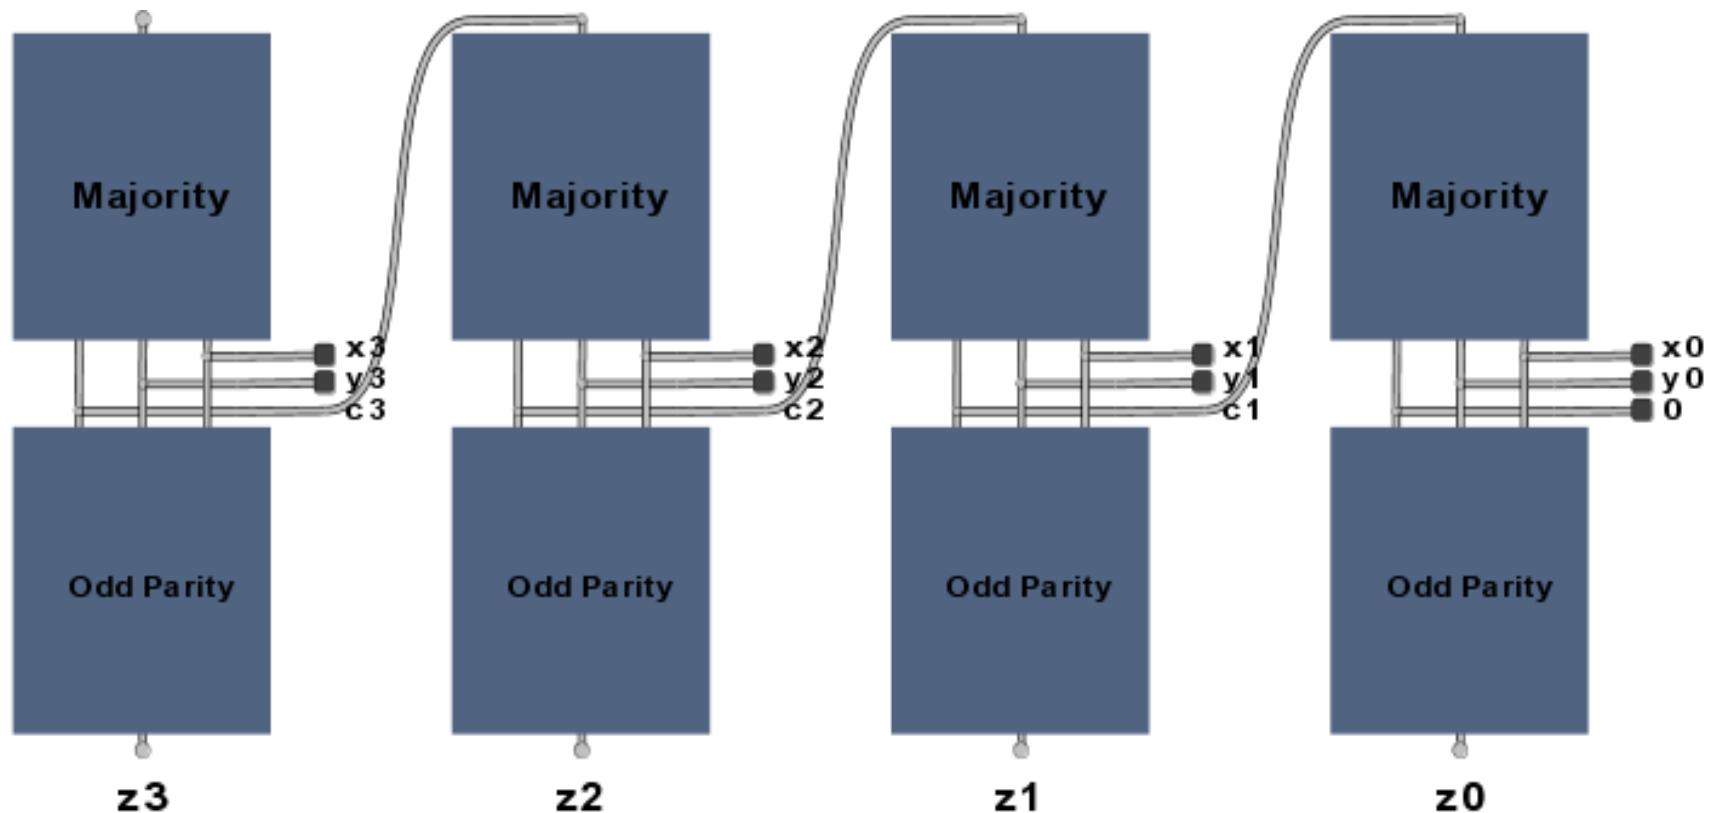

Summand Bit				
$x_i$	$y_i$	$c_i$	$z_i$	ODD
0	0	0	0	0
0	0	1	1	1
0	1	0	1	1
0	1	1	0	0
1	0	0	1	1
1	0	1	0	0
1	1	0	0	0
1	1	1	1	1

# Let's Make an Adder Circuit

Goal:  $x + y = z$  for 4-bit integers.

## Step 4.

- Transform Boolean expression into circuit.
- Chain together 1-bit adders.

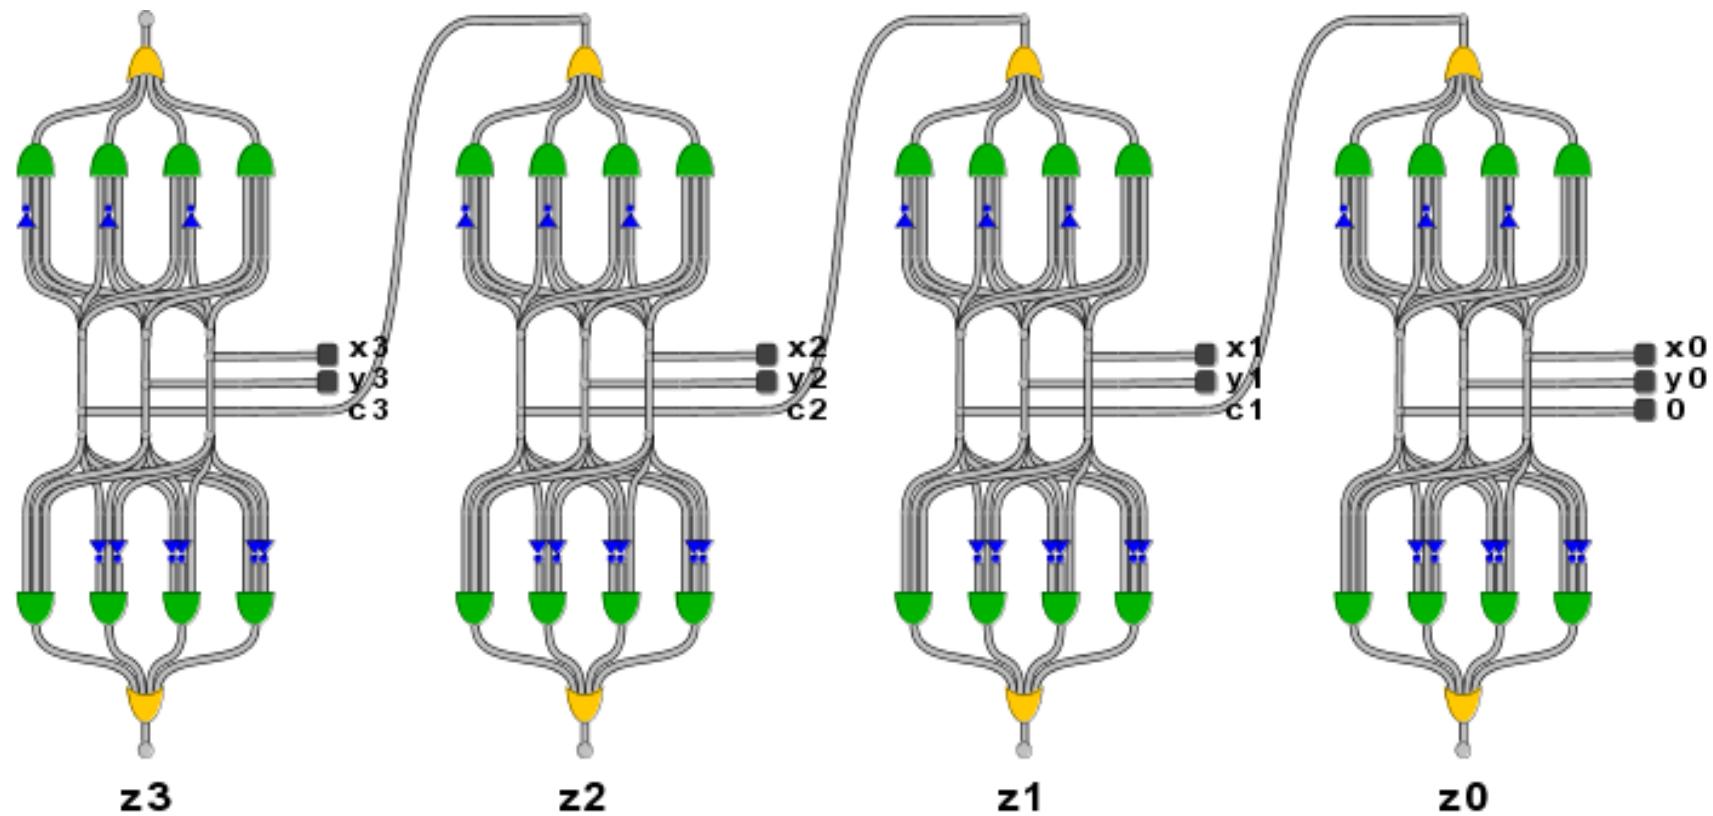

# Let's Make an Adder Circuit

Goal:  $x + y = z$  for 4-bit integers.

## Step 4.

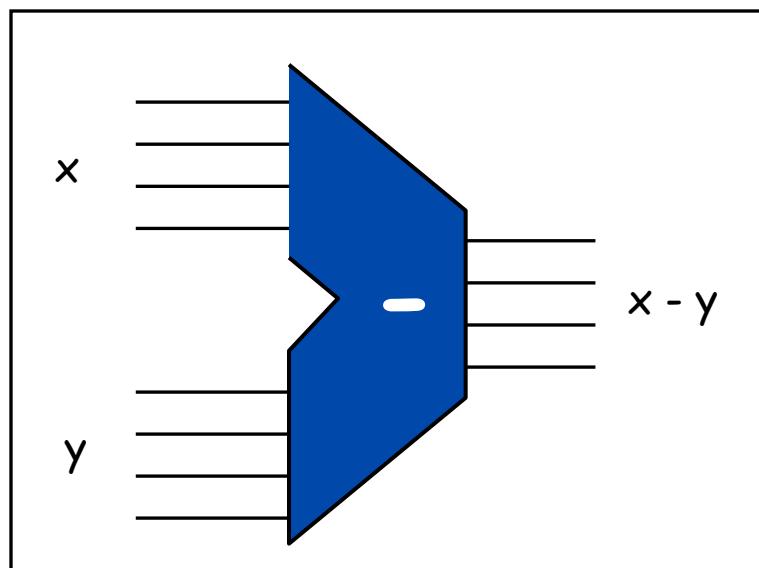

- Transform Boolean expression into circuit.
- Chain together 1-bit adders.

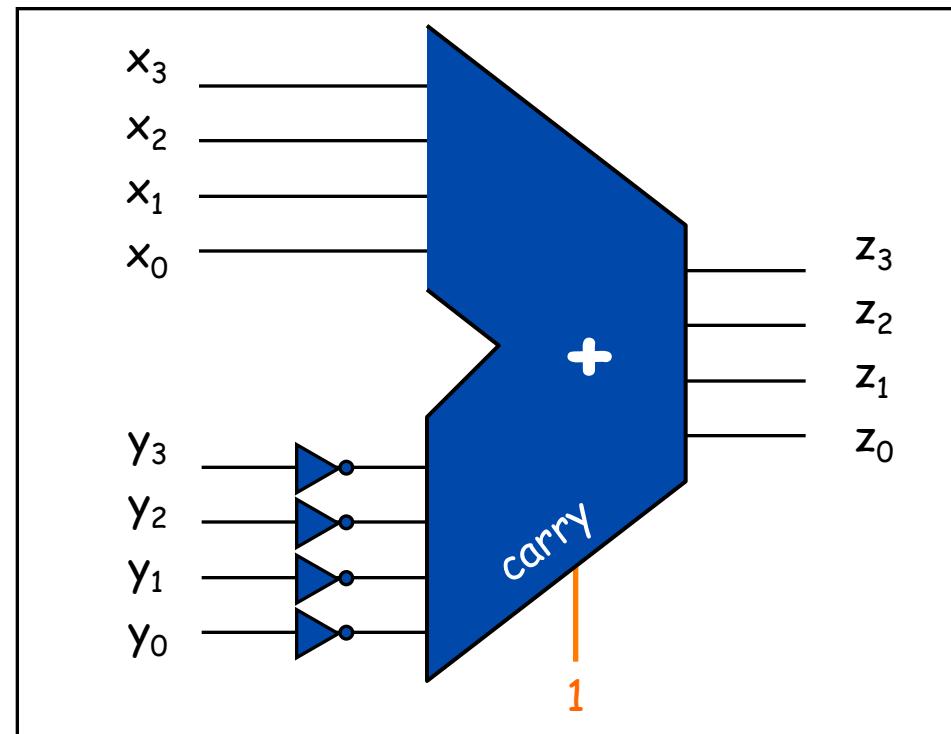

## Subtractor

Subtractor circuit:  $z = x - y$ .

- One approach: design like adder circuit.
- Better idea: reuse adder circuit.
  - 2's complement: to negate an integer, flip bits, then add 1

4-Bit Subtractor Interface

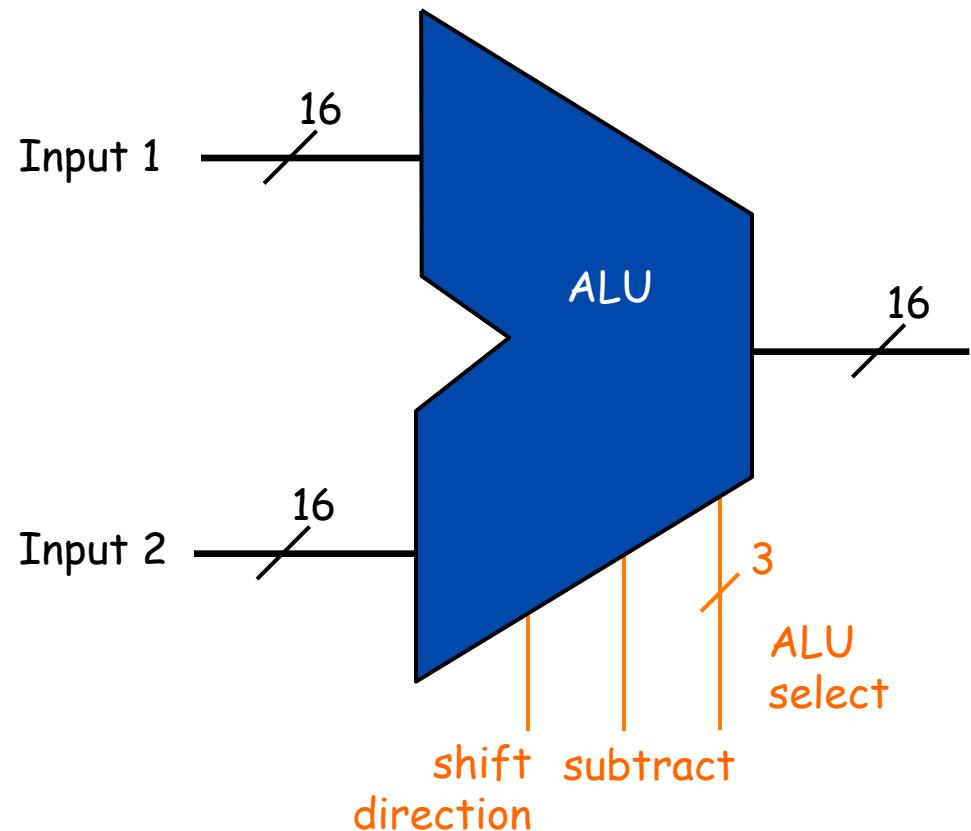

4-Bit Subtractor Implementation

# Arithmetic Logic Unit: Interface

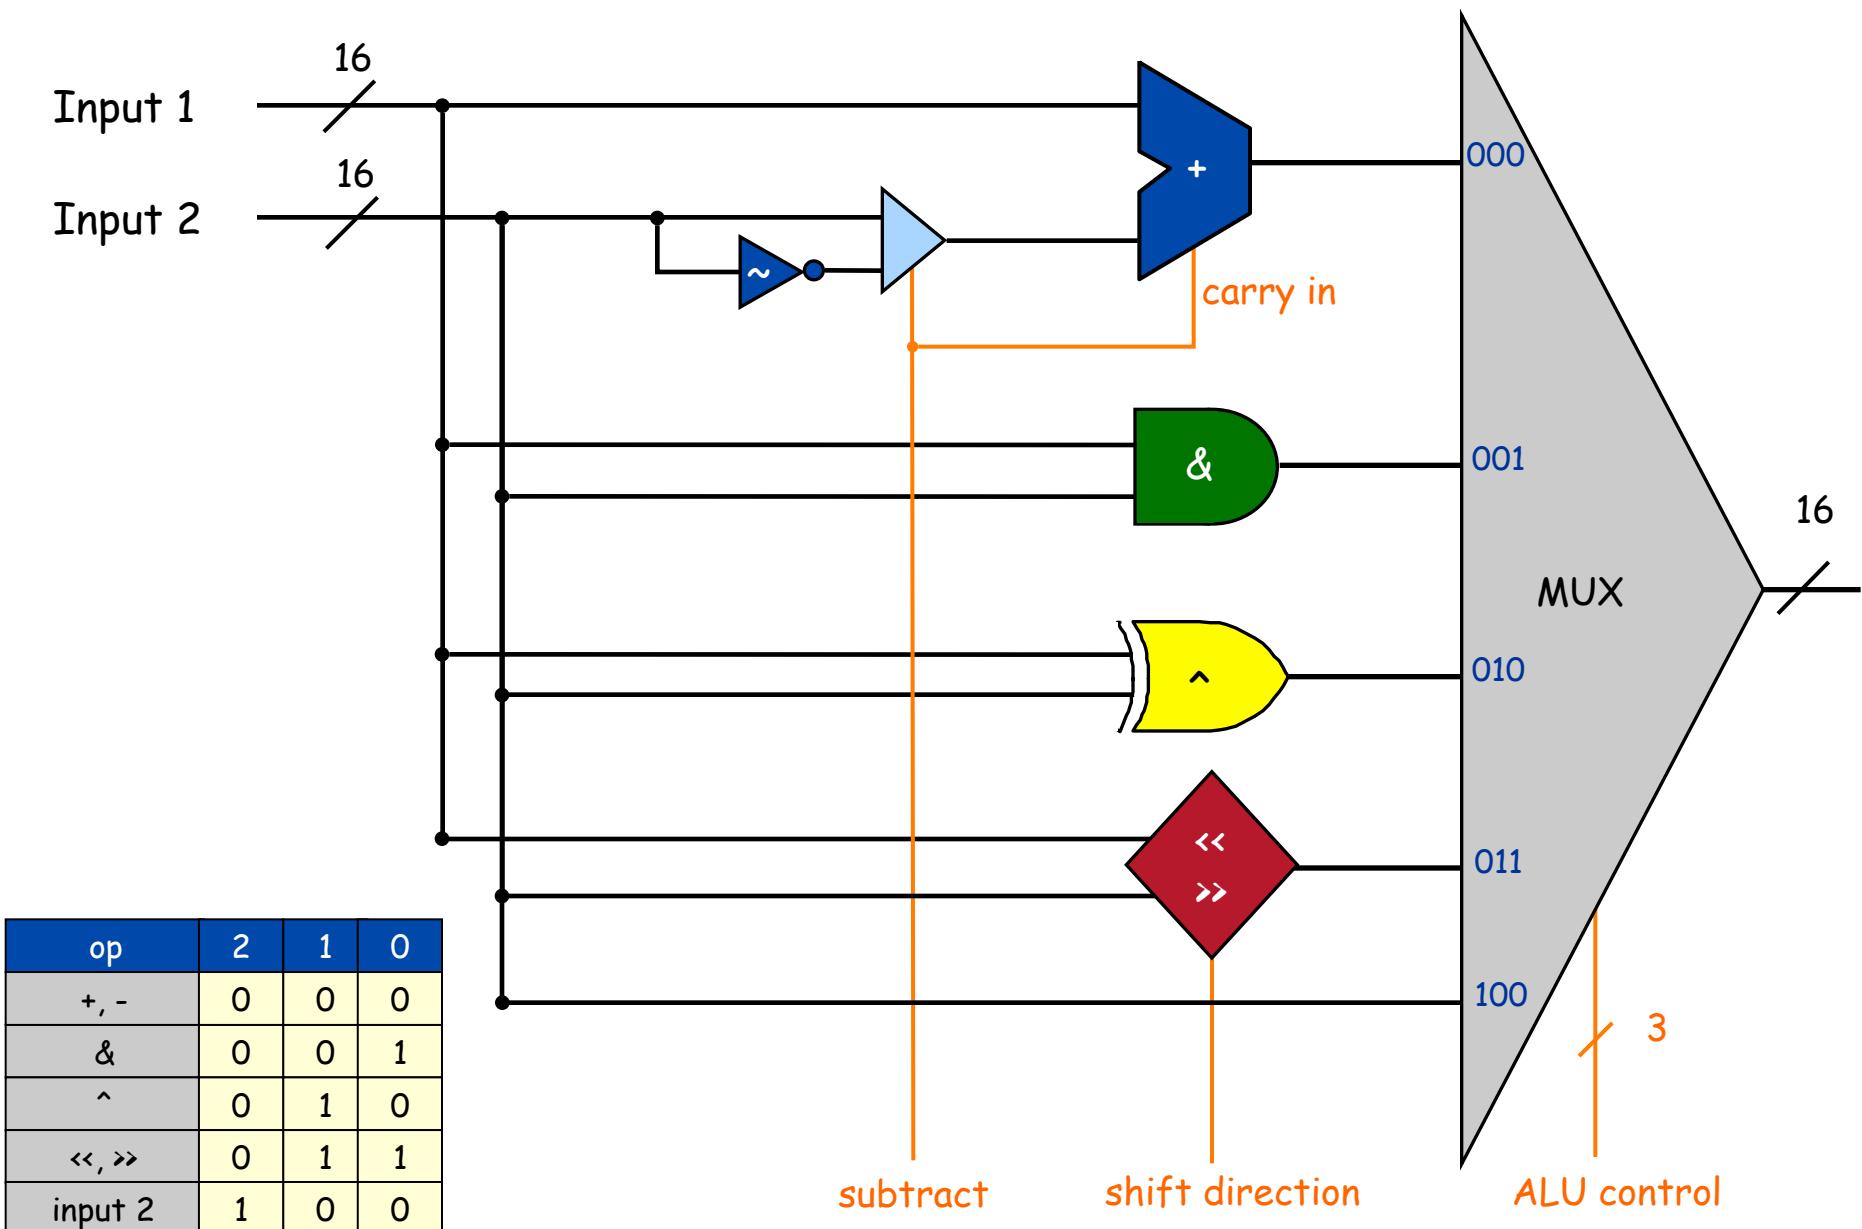

## ALU Interface.

- Add, subtract, bitwise and, bitwise xor, shift left, shift right, copy.
- Associate 3-bit integer with 5 primary ALU operations.
  - ALU performs operations in parallel
  - control wires select which result ALU outputs

op	2	1	0
+ , -	0	0	0
&	0	0	1
^	0	1	0
<< , >>	0	1	1
input 2	1	0	0

# Arithmetic Logic Unit: Implementation

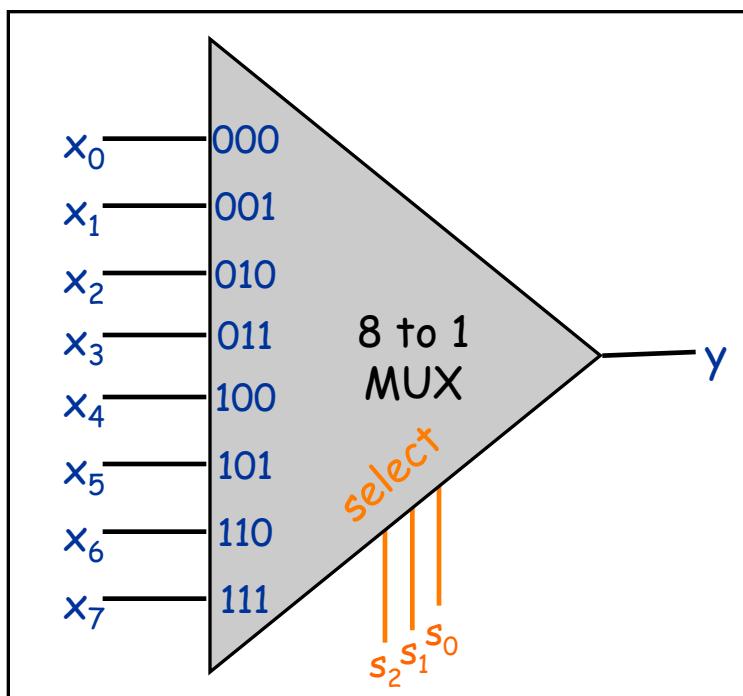

## $2^n$ -to-1 Multiplexer

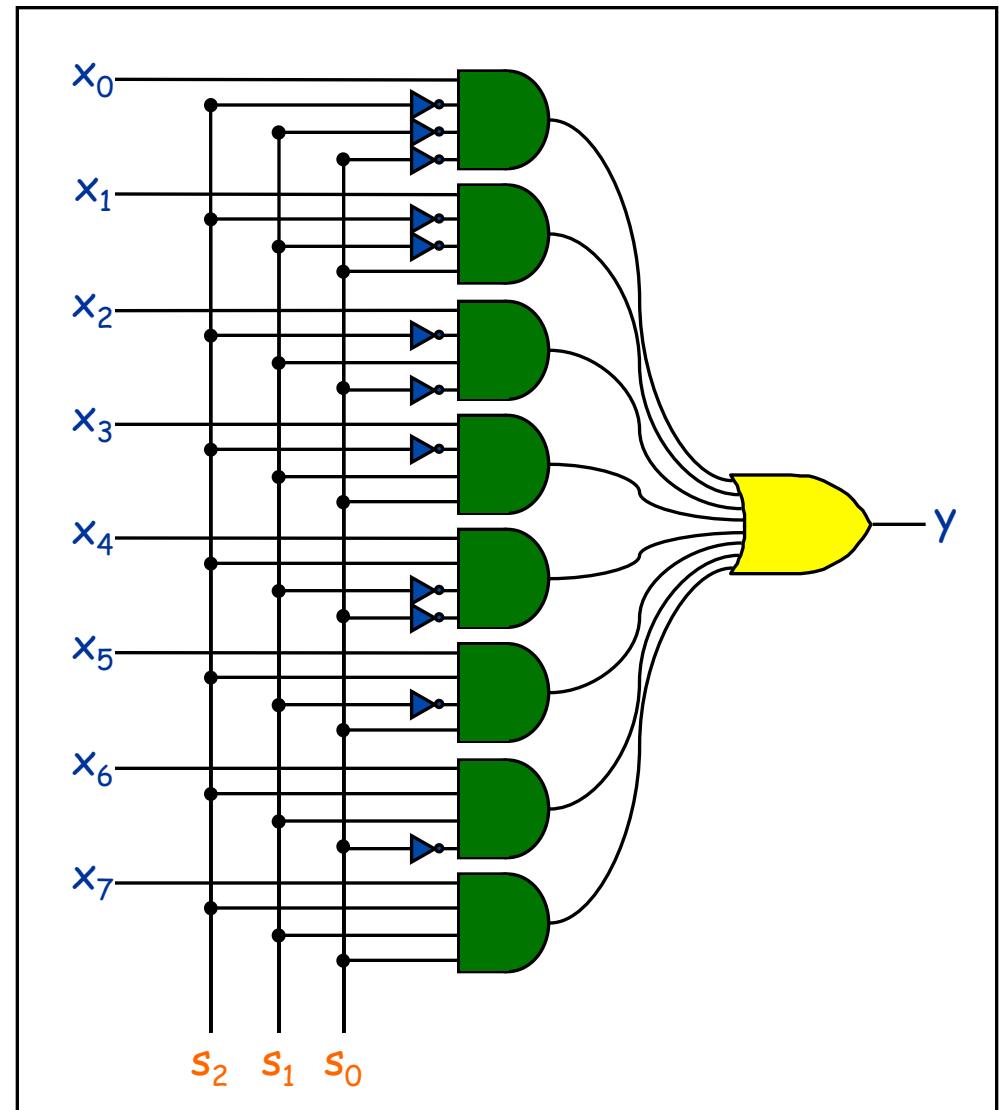

↳  $n = 8$  for main memory

### $2^n$ -to-1 multiplexer.

- $n$  select inputs,  $2^n$  data inputs, 1 output.
- Copies "selected" data input bit to output.

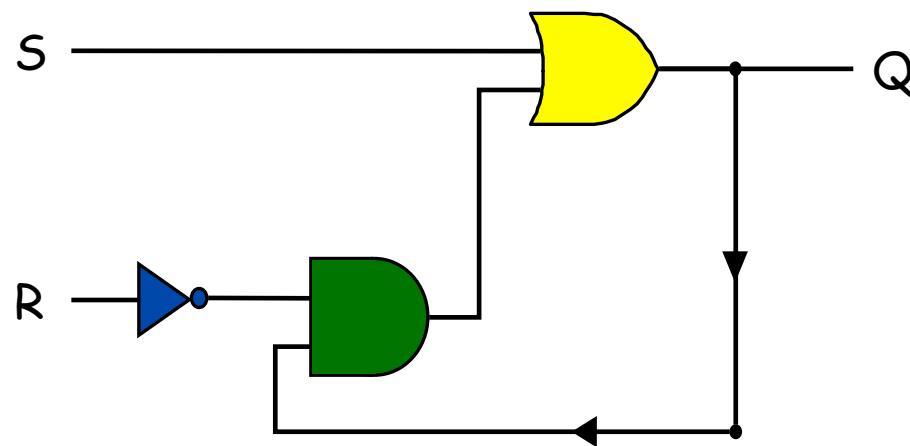

8-to-1 Mux Interface

8-to-1 Mux Implementation

## 6.2: Sequential Circuits

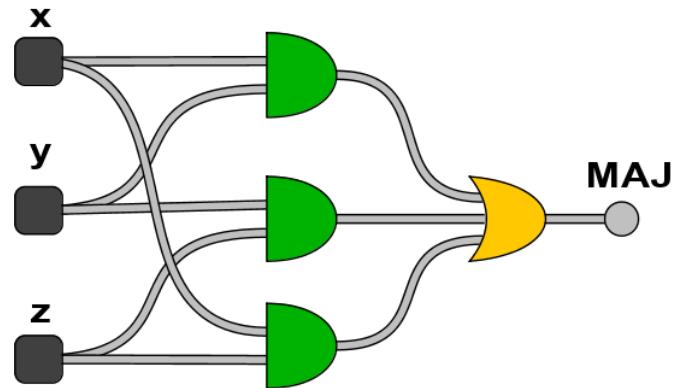

---

# Sequential vs. Combinational Circuits

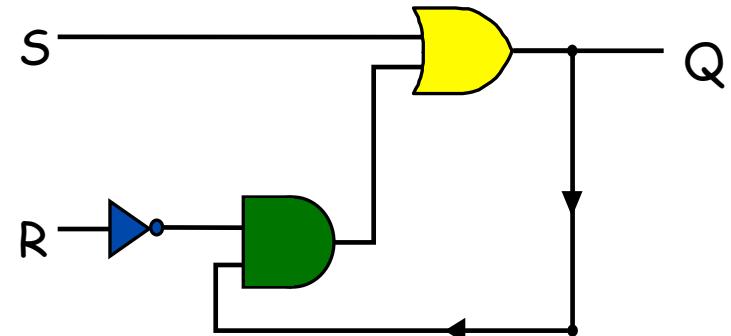

## Combinational circuits.

- Output determined solely by inputs.
- Can draw solely with left-to-right signal paths.

## Sequential circuits.

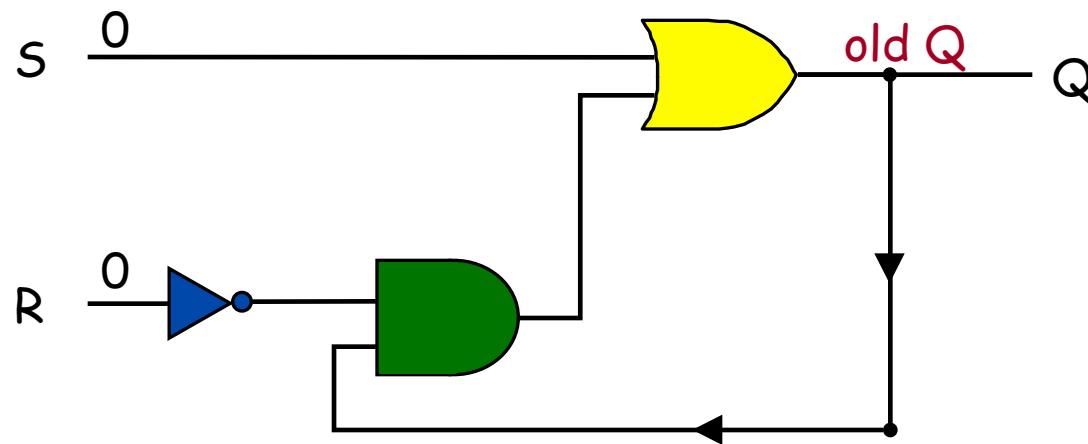

- Output determined by inputs AND previous outputs.
- Feedback loop.

## SR Flip-Flop

What is the value of Q if:

- $S = 1$  and  $R = 0$  ?  $\Rightarrow$  Q is surely 1.
- $S = 0$  and  $R = 1$  ?  $\Rightarrow$  Q is surely 0.
- $S = 0$  and  $R = 0$  ?  $\Rightarrow$  Q is possibly 0 . . . or possibly 1.

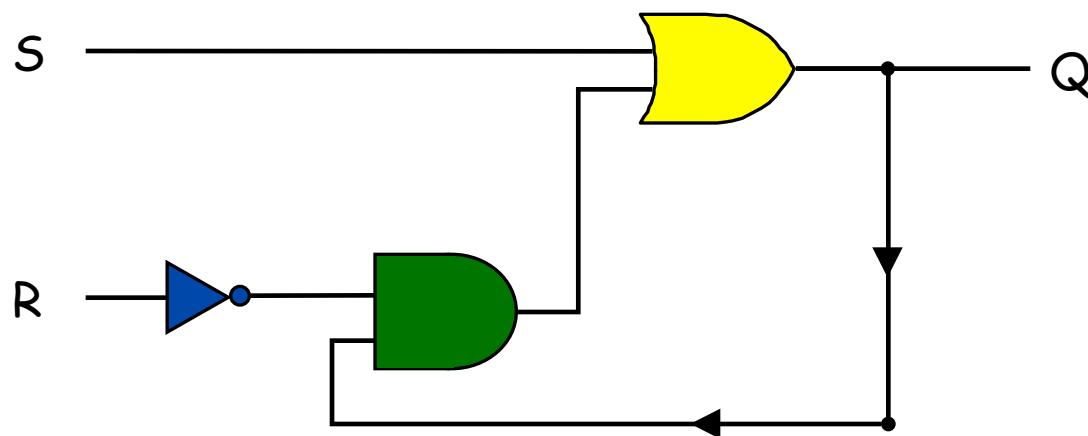

While  $S = R = 0$  , Q remembers what it was the last time S or R was 1.

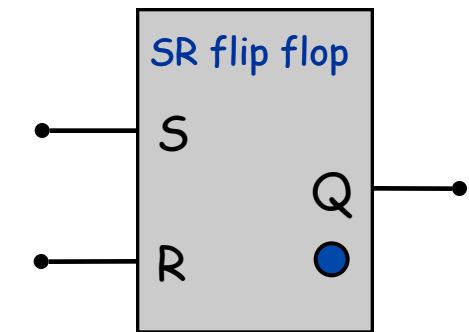

## SR Flip-Flop

### SR Flip-Flop.

- $S = 1, R = 0$  (set)  $\Rightarrow$  "Flips" bit on.
- $S = 0, R = 1$  (reset)  $\Rightarrow$  "Flops" bit off.
- $S = R = 0$   $\Rightarrow$  Status quo.
- $S = R = 1$   $\Rightarrow$  Not allowed.

Implementation

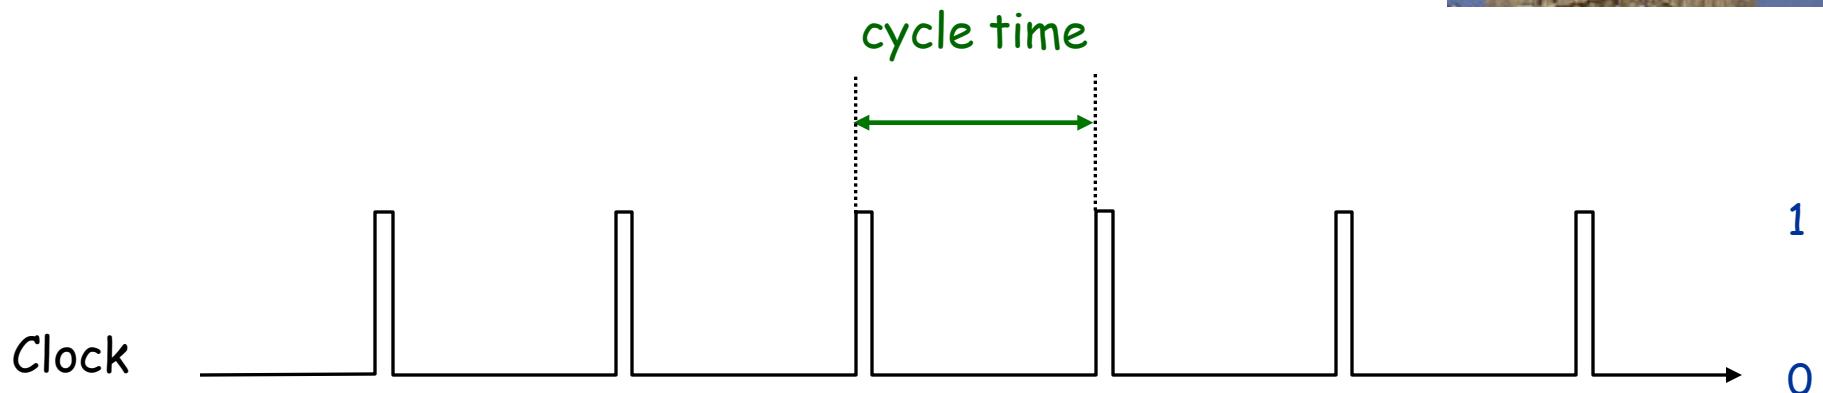

Interface

## Clock

Clock.

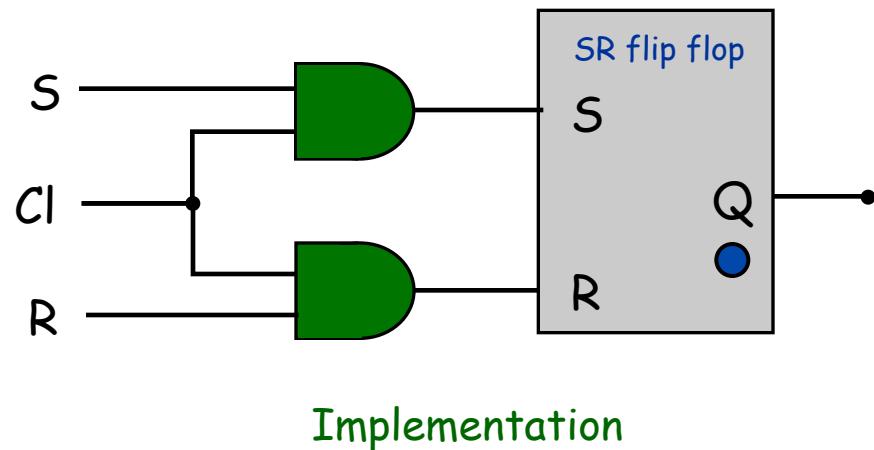

- Fundamental abstraction.
  - regular on-off pulse
- External analog device.
- Synchronizes operations of different circuit elements.
- 1 GHz clock means 1 billion pulses per second.

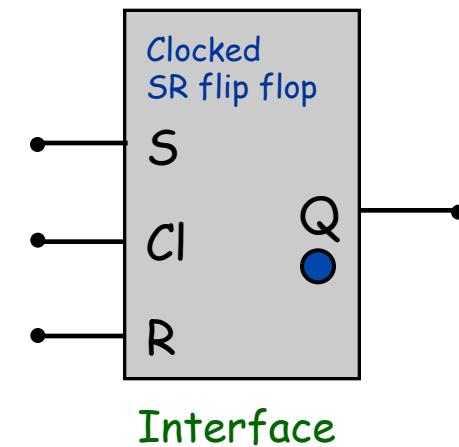

## Clocked SR Flip-Flop

### Clocked SR Flip-Flop.

- Same as SR flip-flop except S and R only active when clock is 1.

Implementation

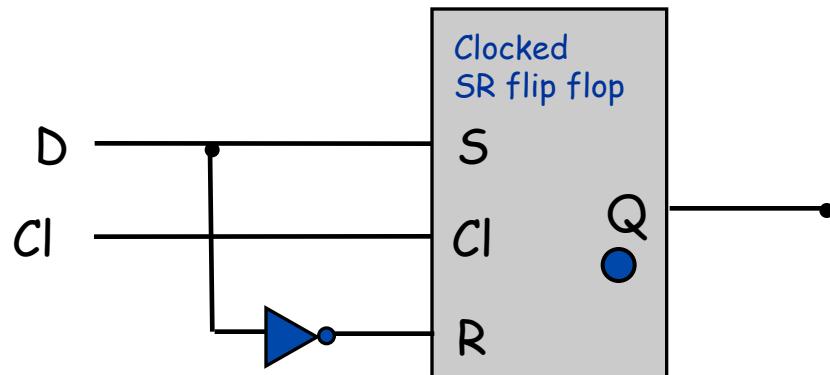

Interface

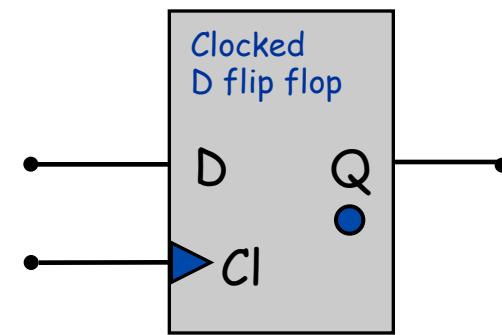

## Clocked D Flip-Flop

### Clocked D Flip-Flop.

- Output follows D input while clock is 1.
- Output is remembered while clock is 0.

Implementation

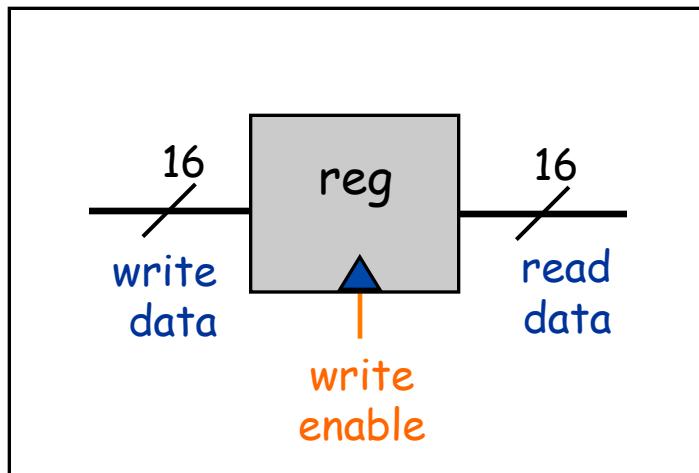

Interface

## Stand-Alone Register

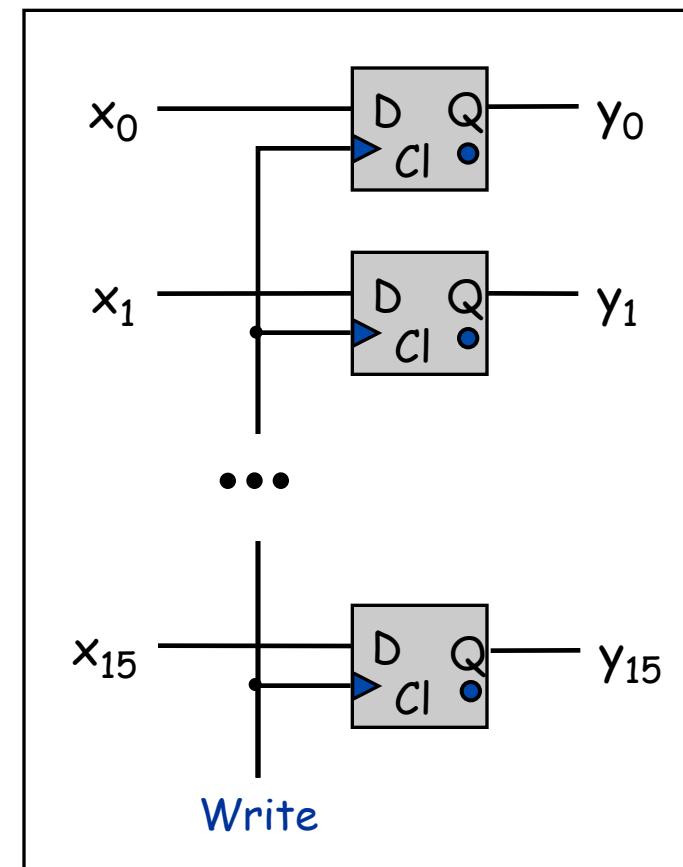

k-bit register.

- Stores k bits.
- Register contents always available on output.
- If write enable is asserted, k input bits get copied into register.

Ex: Program Counter, 16 TOY registers,  
256 TOY memory locations.

16-bit Register Interface

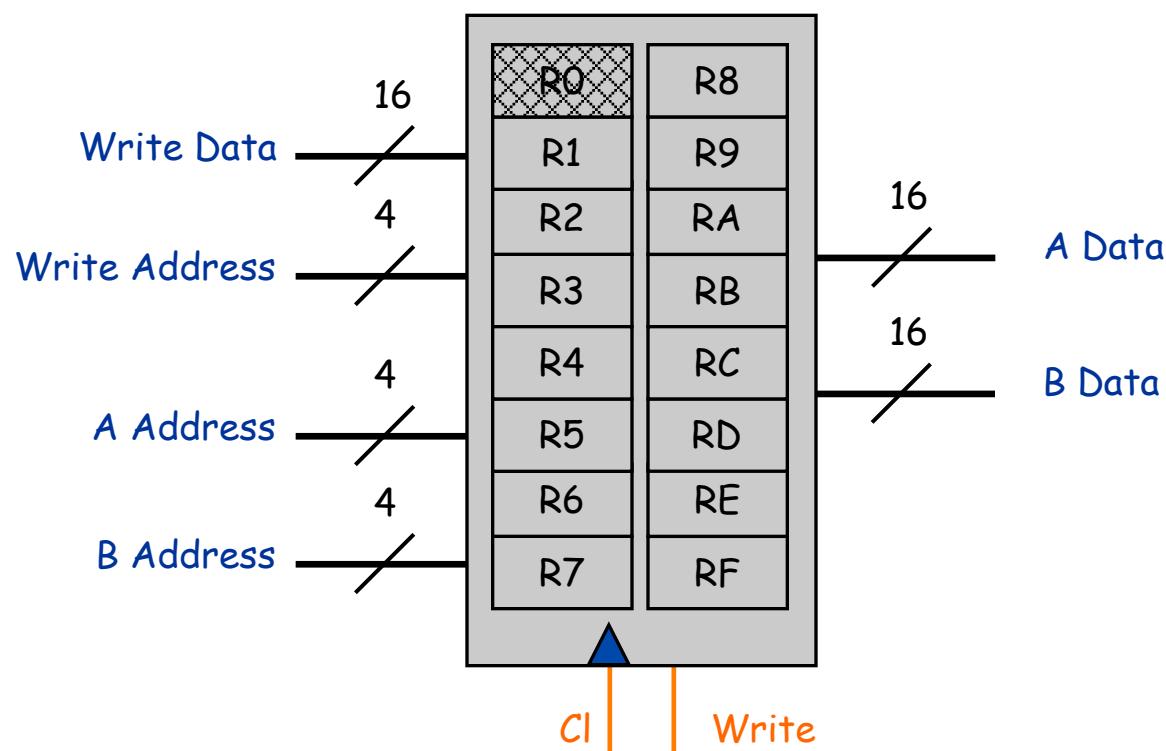

16-bit Register Implementation

# Registers

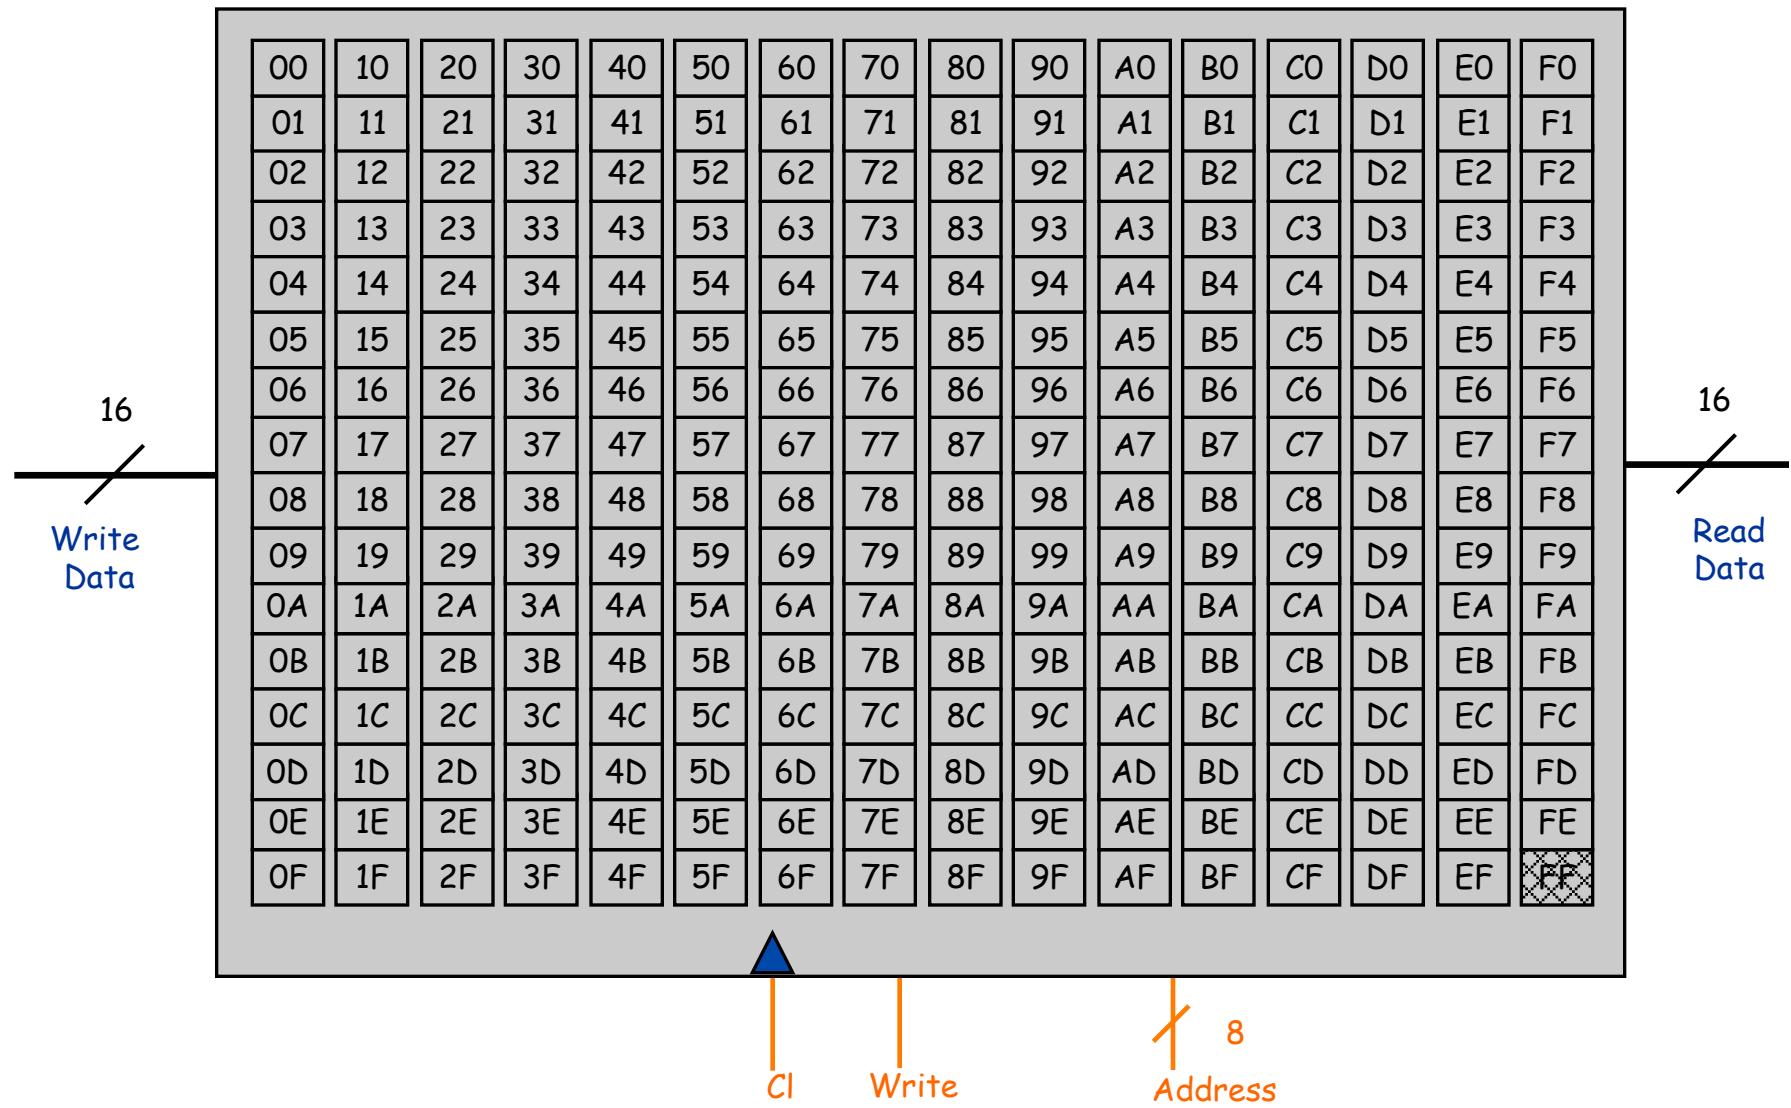

TOY registers: fancy  $16 \times 16$ -bit register file.

- Want to be able to read two registers, and write to a third in the same instructions:  $R1 \leftarrow R2 + R3$ .
- 3 address inputs, 1 data input, 2 data outputs.
- Add decoders and muxes for additional ports.

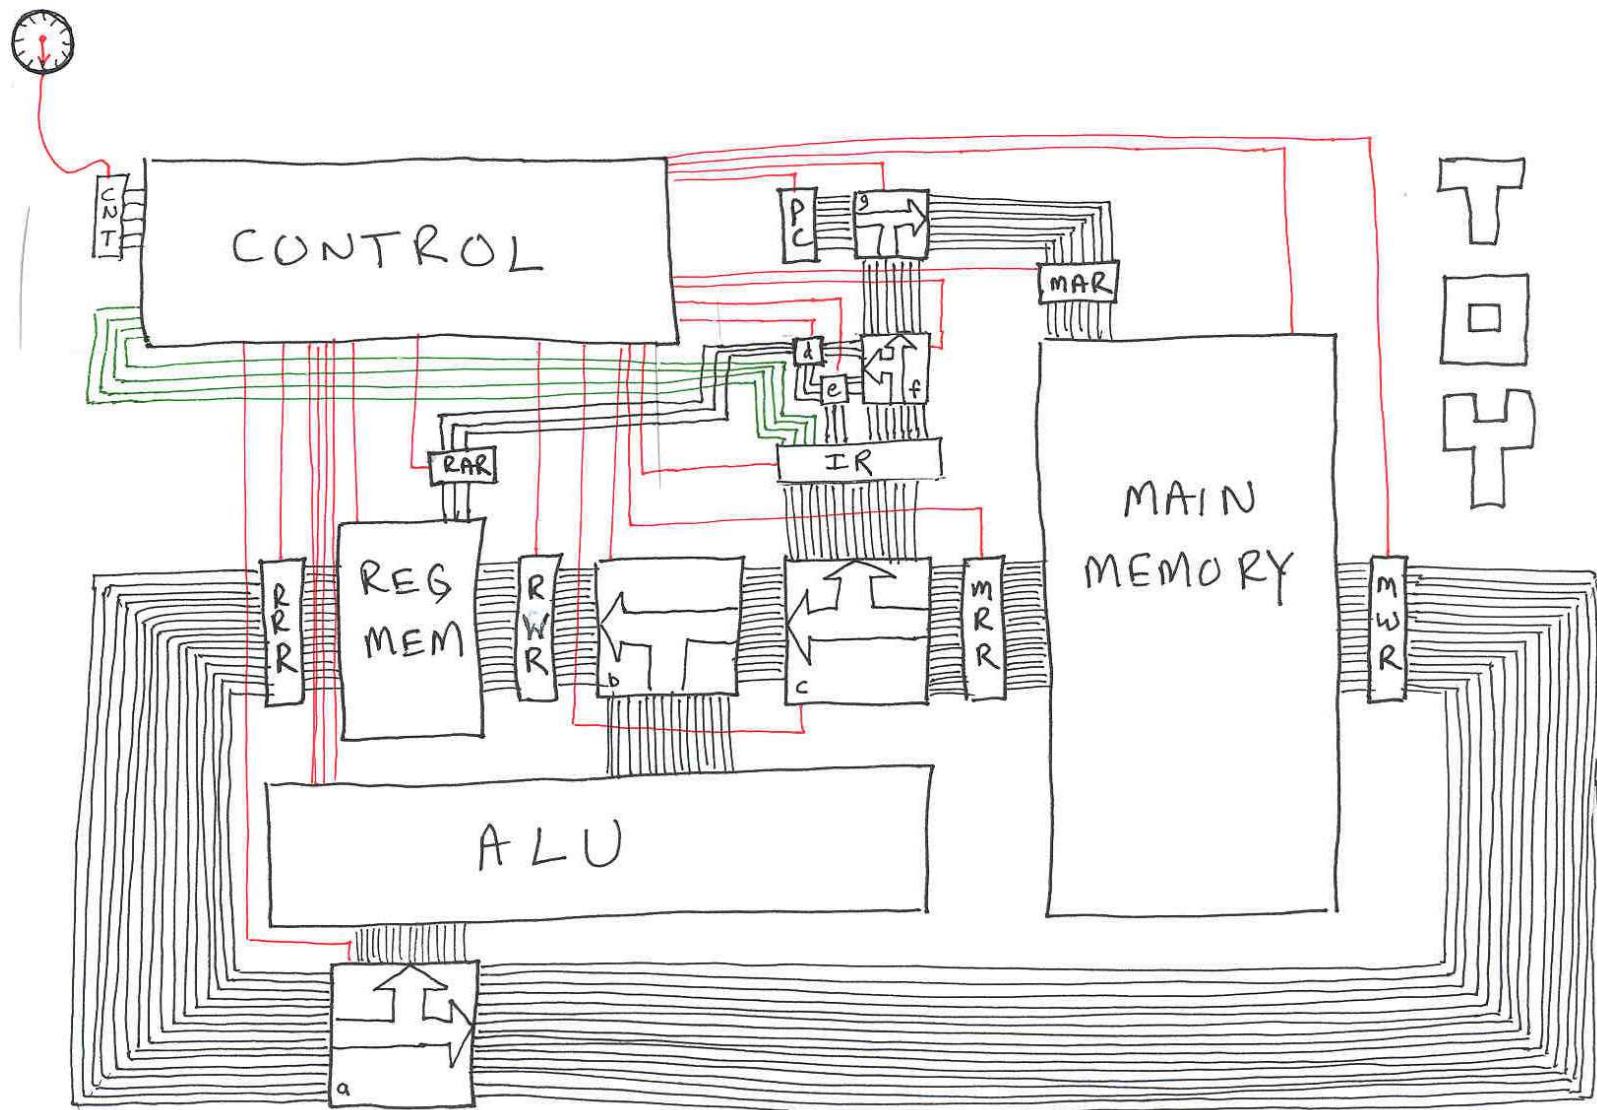

# Main Memory

TOY main memory:  $256 \times 16$ -bit register file.

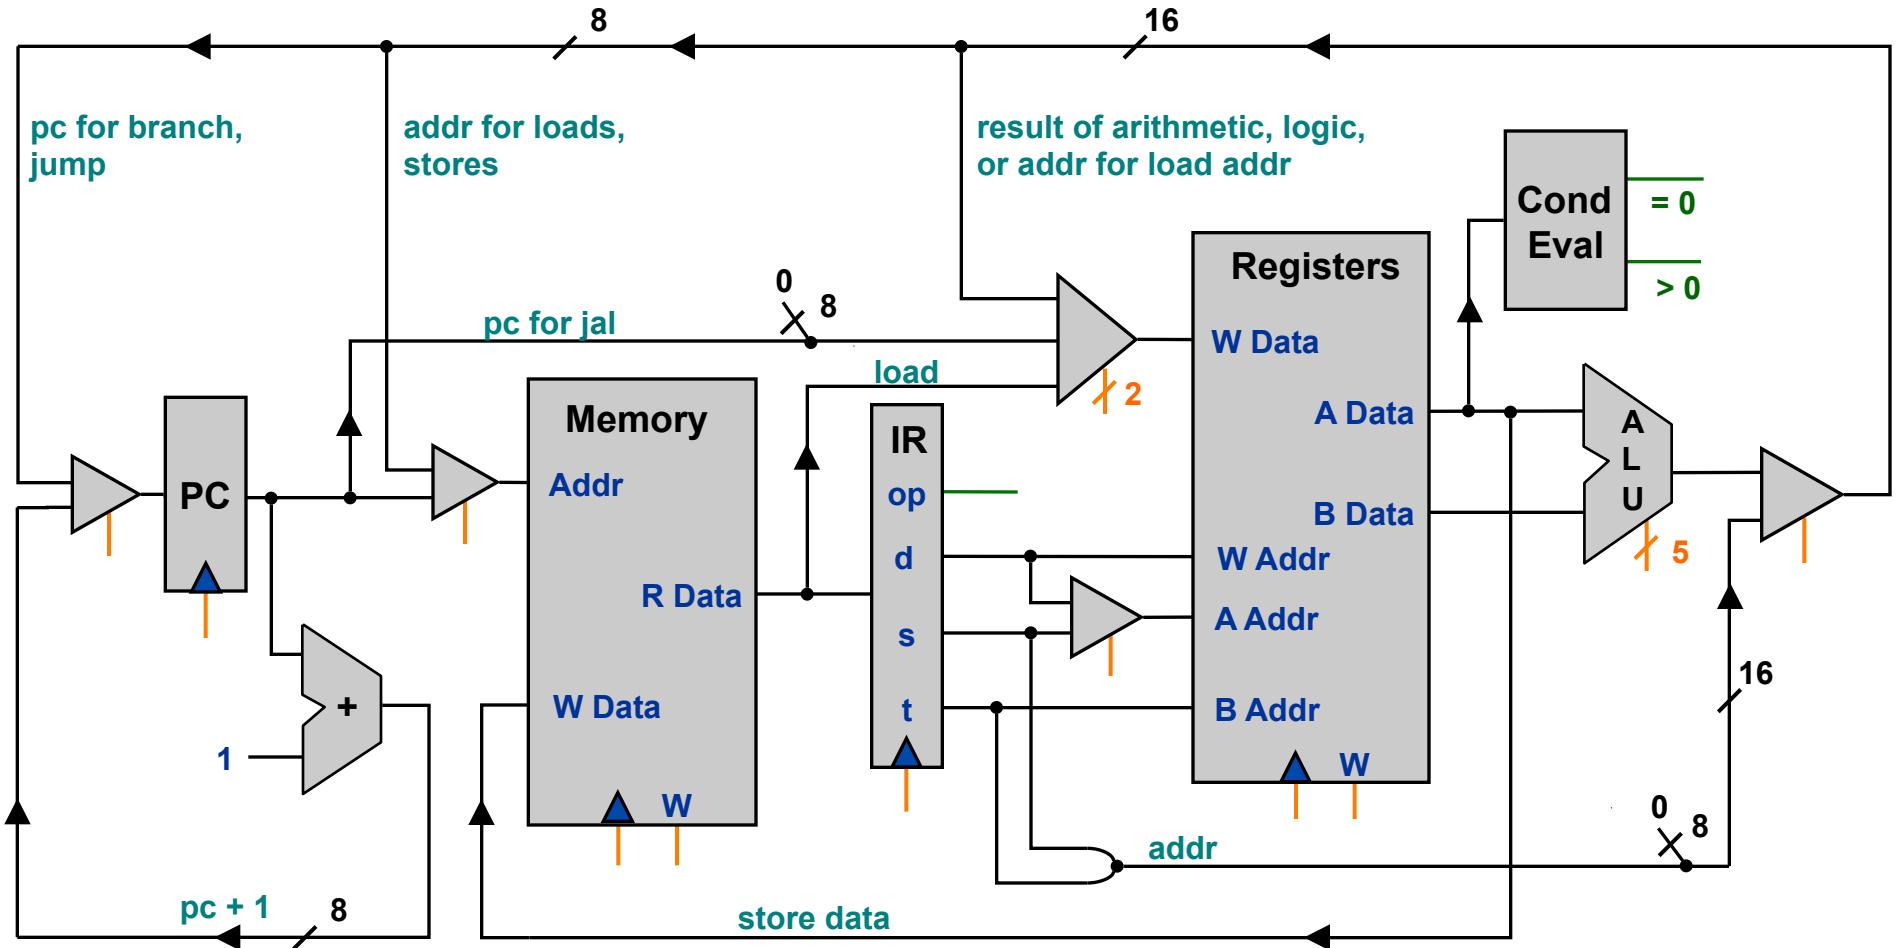

## 6.3: Machine Architecture

---

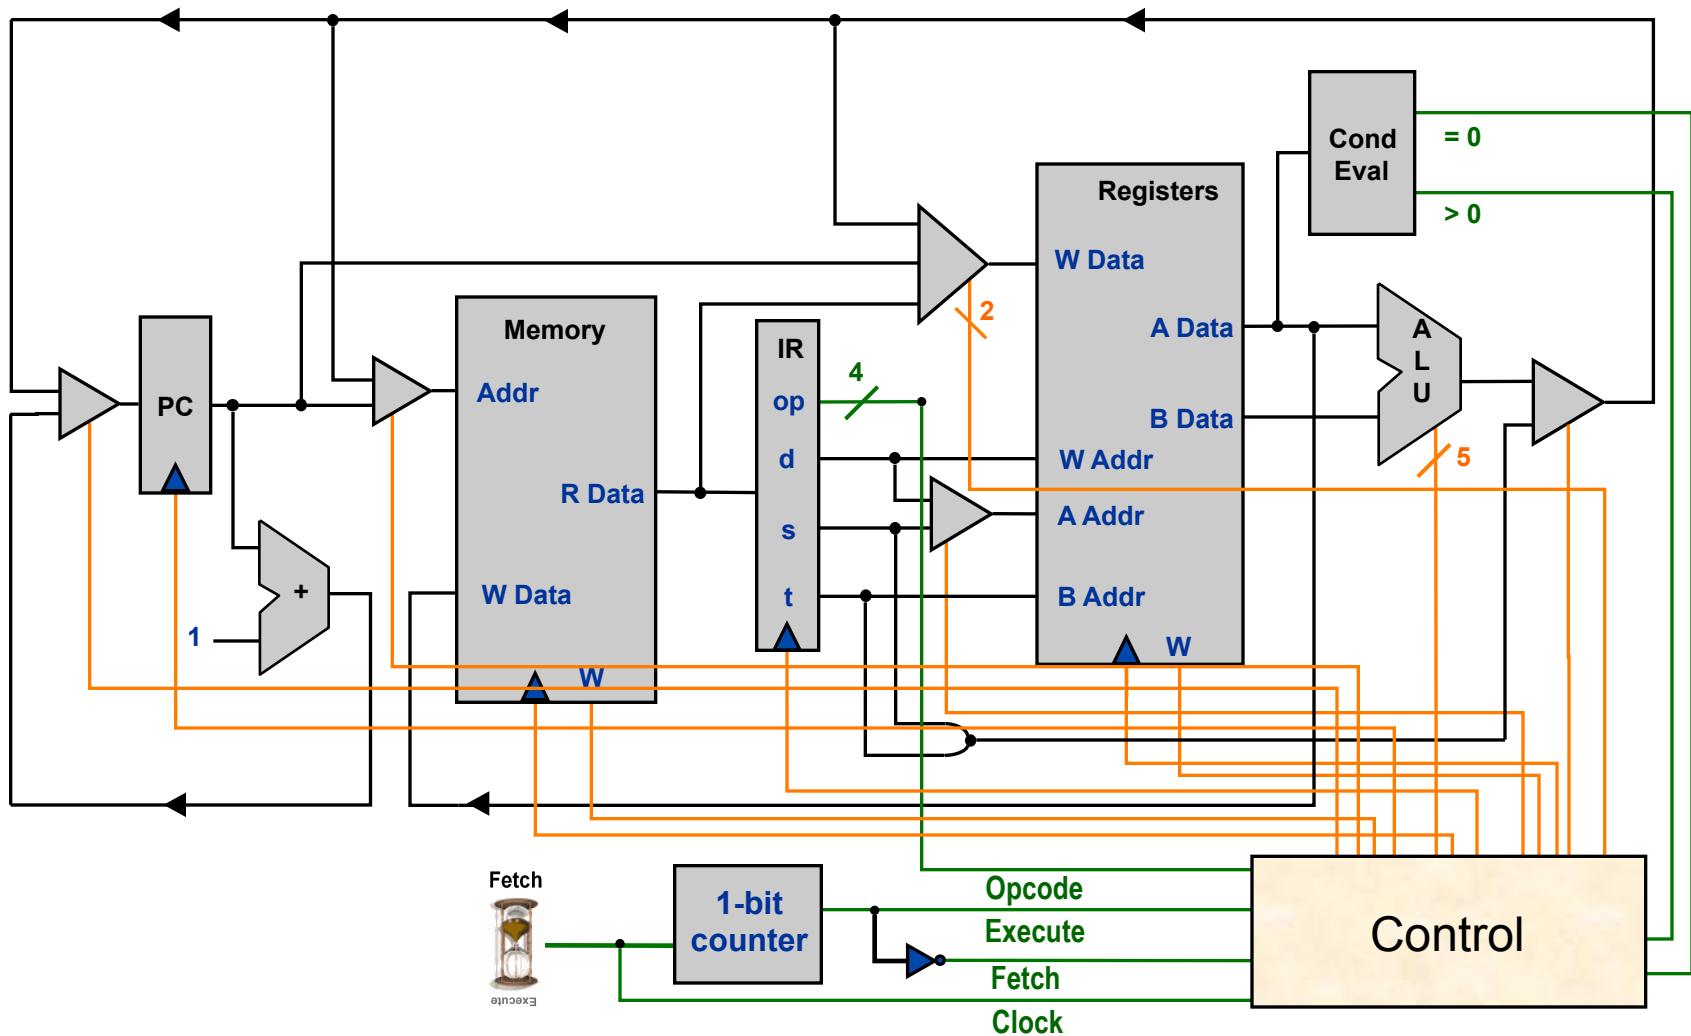

# The TOY Datapath

# Control

Control: controls components, enables connections.

- Input: opcode, clock, conditional evaluation. (green)
- Output: control wires. (orange)

## Summary

### Combinational circuits: how to compute things

- And, Or, Not primitives sufficient for any Boolean function
- Systematic method: truth tables and sum-of-products
- Examples
  - Majority
  - Binary adder
  - Multiplexor

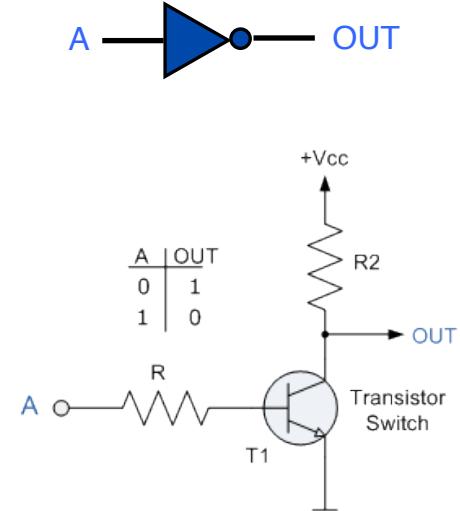

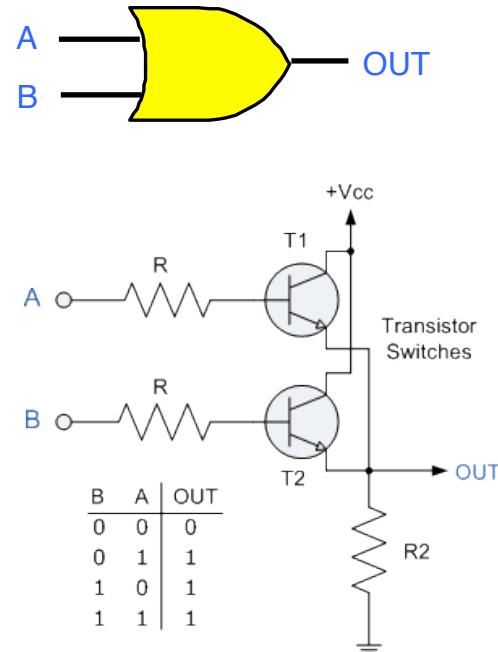

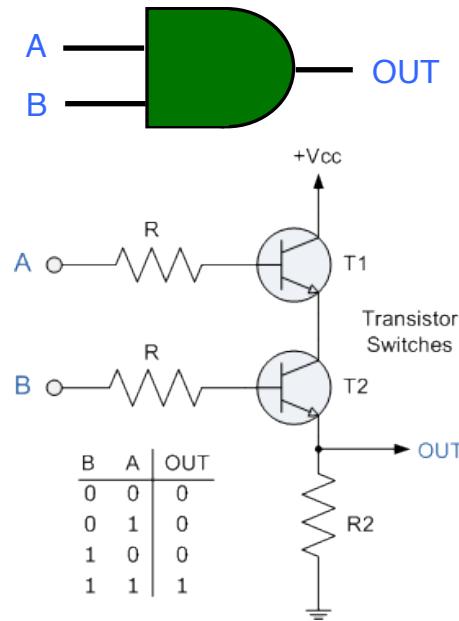

### Sequential circuits: where to put things

- Flip flop primitive holds one bit
- Many flip flops make a *register* (16 for TOY)
- Many registers make a *register file*
- Lots and lot of registers make a *memory* (256 for TOY)

### A whole computer

- Uses *combinational circuits* to perform computations
- Uses *sequential circuits* to store results
- Uses a little of each for control

## The final secret

All three of our logic primitives can be made using a *single\** type of electronic primitive: the *transistor*!

\*not counting the passive resistors
