## COS126 Exam 1 Mini-Test

## 1. Short Answer

1. Here is a 16-bit two's complement binary integer: 1111111111101100. Convert it to decimal. Circle your answer.
2. Write the value of (double) ( $22 / 7$ ).
3. Write the value of b after the following two statements are executed. Remember that Java ints use 32-bit 2's-complement representation:
```
int a = 2147483647; // 2^31 - 1
int b = a + 1;
```

4. Write this number using Java's scientific notation, (without using Math.pow()): $6.022 \cdot 10^{23}$
5. Write a TOY statement to clear Register 5 to zero.
6. You have a program called Recipe.java which reads from standard input and writes to standard output. You have compiled it. The command-line to run it so it reads keyboard input and writes to the terminal screen is: java Recipe.
Write the command-line to run it so it reads input redirected from a file named cookbook.txt.

Write the command-line to run it so it reads input from cookbook.txt and writes to an output file named meal.txt

Write the command-line to run it so it reads keyboard input and pipes the output to another compiled program named HungryThing. java.

## 2. Arrays, Functions

The following two methods do the same job. They each take an ORDERED array of ints and a target number as arguments.

```
public static boolean mystery1(int[] array, int target) {
    for (int i = 0; i < array.length; i++) {
        if (array[i] == target) return true;
        else if (array[i] > target) return false;
    }
    return false;
}
public static boolean mystery2(int[] array, int target) {
    int low = 0;
    int high = array.length - 1;
    while (low <= high) {
        int mid = (low + high) / 2;
        if (array[mid] == target) return true;
        else if (array[mid] < target) low = mid + 1;
        else high = mid - 1;
    }
    return false;
}
```

Use this array to answer the following questions:
int [] a $=\{2,5,11,14,15,27,31\} ;$
a) What does mystery1 $(a, 5)$ return?
b) Fill in the trace table to show that mystery2 (a, 5) returns the same thing.

| target | low | hi | mid | return value |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |

2. Cont'd
c) What do mystery1 $(\mathrm{a}, 20)$ and mystery2 $(\mathrm{a}, 20)$ return?
d) In general, what do these methods do?
3. Performance. The following table gives approximate running times for a program with N inputs for various values of N .

| N | time |
| :---: | ---: |
| 1000 | 5 seconds |
| 2000 | 20 seconds |
| 5000 | 2 minutes |
| 10000 | 8 minutes |

Which of the following best describes the likely running time of this program for $N=100,000$ ?
V. A few minutes
W. A few hours
X. Half a day
Z. A few days

## 4. Recursion, Debugging

There's a bug in the following recursive program. You need to find it and fix it.

```
public class Series{
    public static int func(int j){
        if (j==1) return 1;
        return 2*func(j-1)+5*func(j-2);
    }
    public static void main(String[] args) {
        int N=Integer.parseInt(args[0]);
        if (N<0) {
            System.out.println('(invalid argument'));
            return;
        }
        System.out.println(func(N));
    }
}
```

a. Draw the recursion tree for func(3). You only need to draw the tree up to 3 levels, which means the height of the recursion tree should be no greater than 3 .
b. From the recursion tree in (a), do you see a problem with the program? Explain what is the problem.
