

3.2 Creating Data Types

1

Data Types

Data type. Set of values and operations on those values.

Basic types.

| Data Type | Set of Values | Some Operations |
|----------------------|--|-------------------------|
| <code>boolean</code> | <code>true</code> , <code>false</code> | not, and, or, xor |
| <code>int</code> | -2^{31} to $2^{31} - 1$ | add, subtract, multiply |
| <code>String</code> | sequence of Unicode characters | concatenate, compare |

Last time. Write programs that **use** data types.

Today. Write programs to **create** our own data types.

2

Defining Data Types in Java

To define a data type, define:

- Set of values.
- Operations defined on them.

Java class. Allows us to define data types by specifying:

- **Instance variables.** (set of values)
- **Methods.** (operations defined on them)
- **Constructors.** (create and initialize new objects)

3

Point Charge Data Type

Goal. Create a data type to manipulate point charges.

Set of values. Three real numbers. [position and electrical charge]

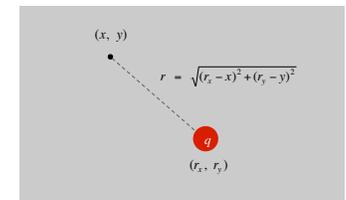

Operations.

- Create a new point charge at (r_x, r_y) with electric charge q .
- Determine electric potential V at (x, y) due to point charge.
- Convert to `String`.

$$V = k \frac{q}{r}$$

r = distance between (x, y) and (r_x, r_y)

k = electrostatic constant = $8.99 \times 10^9 \text{ N} \cdot \text{m}^2 / \text{C}^2$

4

Point Charge Data Type

Goal. Create a data type to manipulate point charges.

Set of values. Three real numbers. [position and electrical charge]

API:

```
public class Charge
{
    Charge(double x0, double y0, double q0)
    double potentialAt(double x, double y) electric potential at (x, y) due to charge
    String toString() string representation
}
```

5

Charge Data Type: A Simple Client

Client program. Uses data type operations to calculate something.

```
public static void main(String[] args)
{
    double x = Double.parseDouble(args[0]);
    double y = Double.parseDouble(args[1]);
    Charge c1 = new Charge(.51, .63, 21.3);
    Charge c2 = new Charge(.13, .94, 81.9);
    double v1 = c1.potentialAt(x, y);
    double v2 = c2.potentialAt(x, y);
    StdOut.println(c1); ← automatically invokes the toString() method
    StdOut.println(c2); ←
    StdOut.println(v1 + v2);
}
```

```
% java Charge .50 .50
21.3 at (0.51, 0.63)
81.9 at (0.13, 0.94)
2.74936907085912e12
```

6

Anatomy of Instance Variables

Instance variables. Specifies the set of values.

- Declare outside any method. ← makes data type abstract
- Always use access modifier **private**.
- Use modifier **final** with instance variables that never change.

← makes objects immutable (stay tuned)

```
public class Charge
{
    private final double rx, ry;
    private final double q;
    .
    .
}
```

Annotations: *instance variable declarations* (points to the variable names), *modifiers* (points to **private final**).

7

Anatomy of a Constructor

Constructor. Specifies what happens when you create a new object.

```
public Charge ( double x0 , double y0 , double q0 )
{
    rx = x0;
    ry = y0;
    q = q0;
}
```

Annotations: *access modifier* (points to **public**), *no return type* (points to the space before **Charge**), *constructor name (same as class name)* (points to **Charge**), *argument variables* (points to **double x0, double y0, double q0**), *signature* (points to the entire line), *instance variable names* (points to **rx, ry, q**), *body* (points to the assignment statements).

Invoking a constructor. Use **new** operator to create a new object.

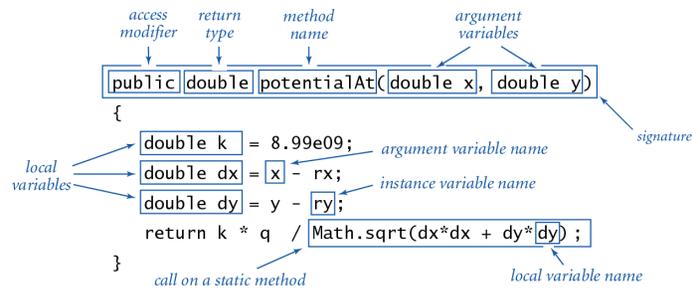

```
Charge c1 = new Charge(.51, .63, 21.3);
Charge c2 = new Charge(.13, .94, 81.9);
```

Annotation: *invoke constructor* (points to **new**).

8

Anatomy of an Instance Method

Method. Define operations on instance variables.

Invoking a method. Use dot operator to invoke a method in client code.

```

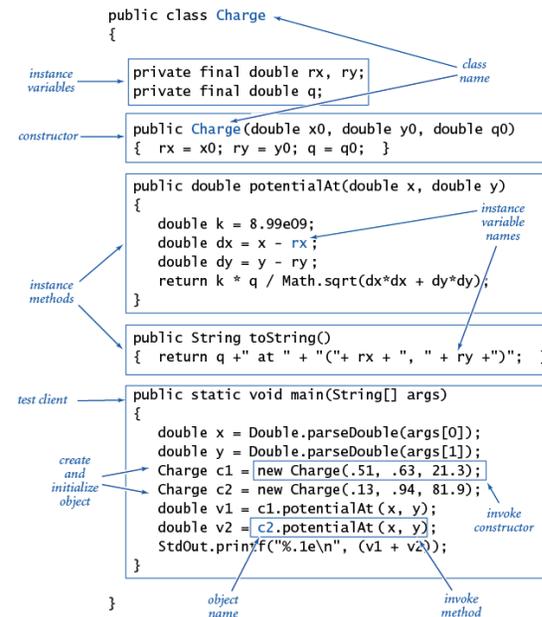

double v1 = c1.potentialAt(x, y);
double v2 = c2.potentialAt(x, y);
    
```

Diagram labels for the code above:

- `c1`: object name
- `.potentialAt(x, y)`: invoke method

9

Anatomy of a Class

10

Charge Client Example: Potential Visualization

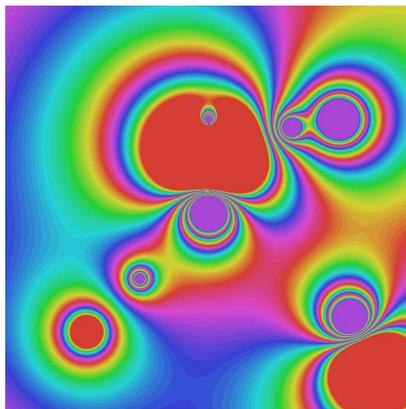

Potential visualization. Read in N point charges from a file; compute total potential at each point in unit square.

```

% more charges.txt
9
.51 .63 -100
.50 .50 40
.50 .72 10
.33 .33 5
.20 .20 -10
.70 .70 10
.82 .72 20
.85 .23 30
.90 .12 -50
    
```

```

% java Potential < charges.txt
    
```

11

Potential Visualization

Arrays of objects. Allocate memory for the array; then allocate memory for each individual object.

```

// Read in the data.
int N = StdIn.readInt();
Charge[] a = new Charge[N];
for (int i = 0; i < N; i++)
{
    double x0 = StdIn.readDouble();
    double y0 = StdIn.readDouble();
    double q0 = StdIn.readDouble();
    a[i] = new Charge(x0, y0, q0);
}
    
```

12

Potential Visualization

```
// Plot the data.
int SIZE = 512;
Picture pic = new Picture(SIZE, SIZE);
for (int col = 0; col < SIZE; col++)
  for (int row = 0; row < SIZE; row++)
  {
    double V = 0.0;
    for (int i = 0; i < N; i++)
    {
      double x = 1.0 * col / SIZE;
      double y = 1.0 * row / SIZE;
      V += a[i].potentialAt(x, y);
    }
    Color color = getColor(V); // Arbitrary double-Color map.
    pic.set(col, SIZE-1-row, color);
  }
pic.show();
```

$$V = \sum_i (k q_i / r_i)$$

(0, 0) is upper left

13

Data Type Challenge

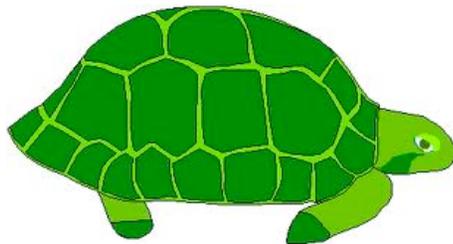

[easy if you read Exercise 3.2.5]

Fix the serious bug in the following code.

```
public class Charge
{
  private double rx, ry;
  private double q;
  public Charge (double x0, double y0, double q0)
  {
    double rx = x0;
    double ry = y0;
    double q = q0;
  }
}
```

14

Turtle Graphics

15

Turtle Graphics

Goal. Create a data type to manipulate a turtle moving in the plane.

Set of values. Location and orientation of turtle.

API. public class Turtle

Turtle(double x0, double y0, double a0) *create a new turtle at (x₀, y₀) facing a₀ degrees counterclockwise from the x-axis*

void turnLeft(double delta) *rotate delta degrees counterclockwise*

void goForward(double step) *move distance step, drawing a line*

```
// Draw a square.
Turtle turtle = new Turtle(0.0, 0.0, 0.0);
turtle.goForward(1.0);
turtle.turnLeft(90.0);
turtle.goForward(1.0);
turtle.turnLeft(90.0);
turtle.goForward(1.0);
turtle.turnLeft(90.0);
turtle.goForward(1.0);
turtle.turnLeft(90.0);
```

16

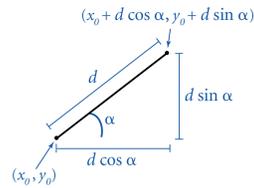

Turtle Graphics Implementation

```
public class Turtle
{
    private double x, y; // turtle is at (x, y)
    private double angle; // facing this direction

    public Turtle(double x0, double y0, double a0)
    {
        x = x0;
        y = y0;
        angle = a0;
    }

    public void turnLeft(double delta)
    {
        angle += delta;
    }

    public void goForward(double d)
    {
        double oldx = x;
        double oldy = y;
        x += d * Math.cos(Math.toRadians(angle));
        y += d * Math.sin(Math.toRadians(angle));
        StdDraw.line(oldx, oldy, x, y);
    }
}
```

17

Turtle client example: N-gon

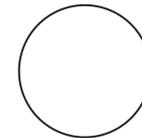

```
public class Ngon
{
    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        double angle = 360.0 / N;
        double step = Math.sin(Math.toRadians(angle/2.0));
        Turtle turtle = new Turtle(0.5, 0, angle/2.0);
        for (int i = 0; i < N; i++)
        {
            turtle.goForward(step);
            turtle.turnLeft(angle);
        }
    }
}
```

3

7

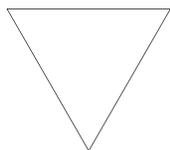

1440

18

Turtle client example: Spira Mirabilis

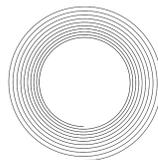

```
public class Spiral
{
    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        double decay = Double.parseDouble(args[1]);
        double angle = 360.0 / N;
        double step = Math.sin(Math.toRadians(angle/2.0));
        Turtle turtle = new Turtle(0.5, 0, angle/2.0);
        for (int i = 0; i < 10 * N; i++)
        {
            step /= decay;
            turtle.goForward(step);
            turtle.turnLeft(angle);
        }
    }
}
```

19

Spira Mirabilis in Nature

20

Complex Numbers

21

Complex Number Data Type

Goal. Create a data type to manipulate complex numbers.
Set of values. Two real numbers: real and imaginary parts.

API.

```
public class Complex
    Complex(double real, double imag)
    Complex plus(Complex b)           sum of this number and b
    Complex times(Complex b)          product of this number and b
    double abs()                       magnitude
    String toString()                  string representation
```

```
a = 3 + 4i, b = -2 + 3i
a + b = 1 + 7i
a × b = -18 + i
|a| = 5
```

22

Applications of Complex Numbers

Relevance. A quintessential mathematical abstraction.

Applications.

- **Fractals.**
- Impedance in RLC circuits.
- Signal processing and Fourier analysis.
- Control theory and Laplace transforms.
- Quantum mechanics and Hilbert spaces.
- ...

23

Complex Number Data Type: A Simple Client

Client program. Uses data type operations to calculate something.

```
public static void main(String[] args)
{
    Complex a = new Complex( 3.0, 4.0);
    Complex b = new Complex(-2.0, 3.0);
    Complex c = a.times(b);
    StdOut.println("a = " + a);
    StdOut.println("b = " + b);
    StdOut.println("c = " + c);
}
```

result of c.toString()

```
% java TestClient
a = 3.0 + 4.0i
b = -2.0 + 3.0i
c = -18.0 + 1.0i
```

Remark. Can't write $a = b * c$ since no operator overloading in Java.

24

Complex Number Data Type: Implementation

```

public class Complex
{
    private final double re;           instance variables
    private final double im;

    public Complex(double real, double imag)    constructor
    {
        re = real;
        im = imag;
    }

    public String toString()                methods
    { return re + " + " + im + "i"; }

    public double abs()
    { return Math.sqrt(re*re + im*im); }

    public Complex plus(Complex b)
    {
        double real = re + b.re;
        double imag = im + b.im;
        return new Complex(real, imag);
    }

    public Complex times(Complex b)
    {
        double real = re * b.re - im * b.im;
        double imag = re * b.im + im * b.re;
        return new Complex(real, imag);
    }
}
    
```

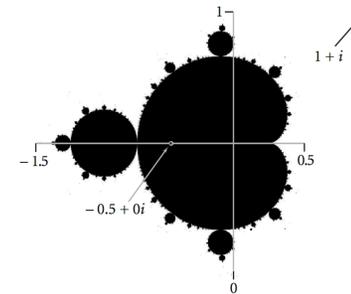

← refers to b's instance variables

25

Mandelbrot Set

Mandelbrot set. A particular set of complex numbers.

Plot. Plot (x, y) black if $z = x + yi$ is in the set, and white otherwise.

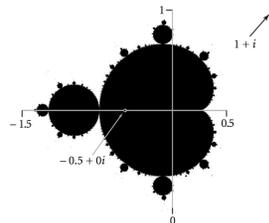

- No simple formula describes which complex numbers are in set.
- Instead, describe using an **algorithm**.

26

Mandelbrot Set

Mandelbrot set. Is complex number z_0 in set?

- Iterate $z_{t+1} = (z_t)^2 + z_0$.
- If $|z_t|$ diverges to infinity, then z_0 not in set; otherwise z_0 is in set.

| t | Z_t |
|---|-------------------------------|
| 0 | $-1/2 + 0i$ |
| 1 | $-1/4 + 0i$ |
| 2 | $-7/16 + 0i$ |
| 3 | $-79/256 + 0i$ |
| 4 | $-26527/65536 + 0i$ |
| 5 | $-1443801919/4294967296 + 0i$ |

$z = -1/2$ is in Mandelbrot set

| t | Z_t |
|---|-----------------------|
| 0 | $1 + i$ |
| 1 | $1 + 3i$ |
| 2 | $-7 + 7i$ |
| 3 | $1 - 97i$ |
| 4 | $-9407 - 193i$ |
| 5 | $88454401 + 3631103i$ |

$z = 1 + i$ not in Mandelbrot set

27

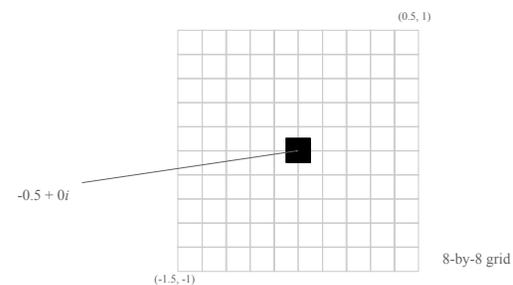

Plotting the Mandelbrot Set

Practical issues.

- Cannot plot infinitely many points.
- Cannot iterate infinitely many times.

Approximate solution.

- Sample from an N -by- N grid of points in the plane.
- Fact: if $|z_t| > 2$ for any t , then z not in Mandelbrot set.
- Pseudo-fact: if $|z_{255}| \leq 2$ then z "likely" in Mandelbrot set.

28

Complex Number Data Type: Another Client

Mandelbrot function with complex numbers.

- Is z in the Mandelbrot set?
- Returns white (definitely no) or black (probably yes).

```
public static Color mand(Complex z0)
{
    Complex z = z0;
    for (int t = 0; t < 255; t++)
    {
        if (z.abs() > 2.0) return Color.WHITE;
        z = z.times(z);
        z = z.plus(z0);
    }
    return Color.BLACK;
}
```

$z = z^2 + z_0$

More dramatic picture: replace `Color.WHITE` with grayscale or color.

`new Color(255-t, 255-t, 255-t)`

29

Complex Number Data Type: Another Client

Plot the Mandelbrot set in gray scale.

```
public static void main(String[] args)
{
    double xc = Double.parseDouble(args[0]);
    double yc = Double.parseDouble(args[1]);
    double size = Double.parseDouble(args[2]);
    int N = 512;
    Picture pic = new Picture(N, N);

    for (int x = 0; x < N; x++)
        for (int y = 0; y < N; y++)
        {
            double x0 = xc - size/2 + size*x/N;
            double y0 = yc - size/2 + size*y/N;
            Complex z0 = new Complex(x0, y0);
            Color color = mand(z0);
            pic.set(x, N-1-y, color);
        }
    pic.show();
}
```

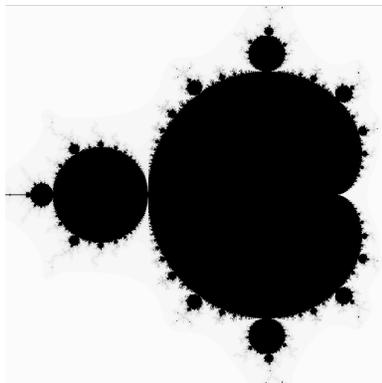

scale to screen coordinates

(0, 0) is upper left

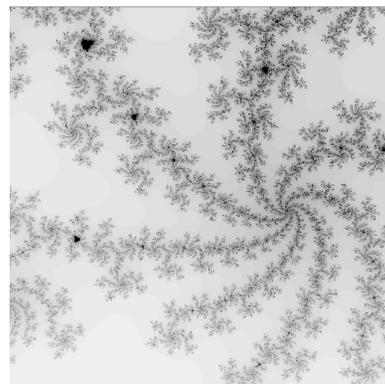

30

Mandelbrot Set

```
% java Mandelbrot -1.5 0 2
```

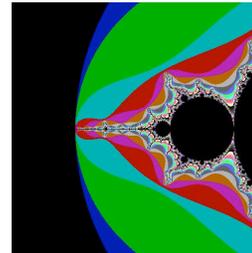

```
% java Mandelbrot .1045 -.637 .01
```

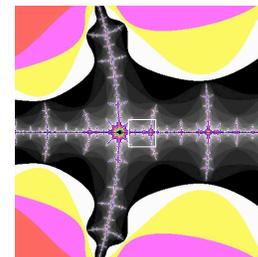

31

Mandelbrot Set

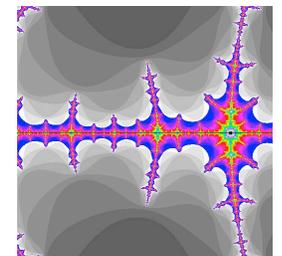

```
% java ColorMandelbrot -1.5 0 2 < mandel.txt
```

```
-1.5 0 .02
```

```
-1.5 0 .002
```

32
