6.1 Combinational Circuits

Claude Shannon (1916 - 2001)

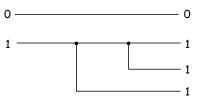

Signals and Wires

Digital signals

Binary (or "logical") values: 1 or 0, on or off, high or low voltage

Wires

- Propagate logical values from place to place.
- Signals "flow" from left to right.
 - A drawing convention, sometimes violated
 - Actually: flow from producer to consumer(s) of signal

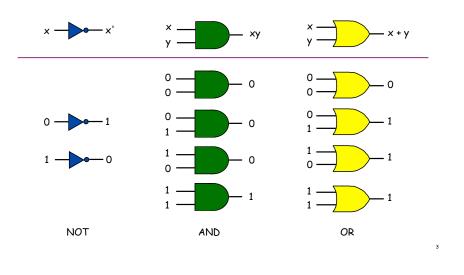

Input Output

Logic Gates

Logical gates.

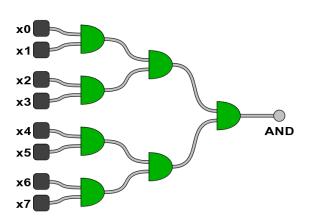

Fundamental building blocks.

Multiway AND Gates

$AND(x_0, x_1, x_2, x_3, x_4, x_5, x_6, x_7).$

- 1 if all inputs are 1.
- 0 otherwise.

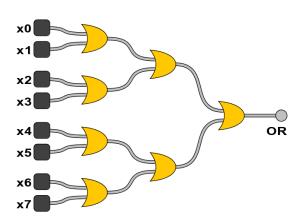

.

Multiway OR Gates

$OR(x_0, x_1, x_2, x_3, x_4, x_5, x_6, x_7).$

- 1 if at least one input is 1.
- 0 otherwise.

Boolean Algebra

History.

- Developed by Boole to solve mathematical logic problems (1847).
- Shannon master's thesis applied it to digital circuits (1937).

"possibly the most important, and also the most famous, master's thesis of the [20th] century" --Howard Gardner

Basics.

- Boolean variable: value is 0 or 1.
- Boolean function: function whose inputs and outputs are 0, 1.

Relationship to circuits.

Boolean variables: signals.Boolean functions: circuits.

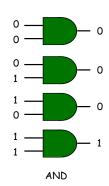

6

- "Universal."
- $\mathbf{XOR}(x,y) = xy' + x'y$

Notation	Meaning
x'	NOTx
×у	x AND y
x + y	x OR y

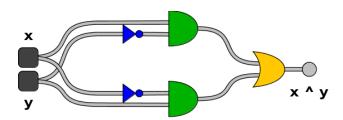

Exercise. Show {AND, NOT}, {OR, NOT}, {NAND}, {AND, XOR} are universal. Hint. Use DeMorgan's Law: (xy)' = (x' + y') and (x + y)' = (x'y')

11

Translate Boolean Formula to Boolean Circuit

Subtractor

Subtractor circuit: z = x - y.

- One approach: new design, like adder circuit.
- Better idea: reuse adder circuit.
 - 2's complement: to negate an integer, flip bits, then add 1

4-Bit Subtractor Interface

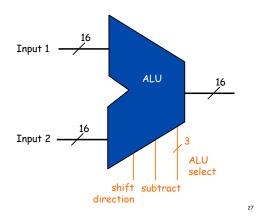

4-Bit Subtractor Implementation

TOY Arithmetic Logic Unit: Interface

ALU Interface.

- Add, subtract, bitwise and, bitwise xor, shift left, shift right, copy.
- Associate 3-bit integer with 5 primary ALU operations.
 - ALU performs operations in parallel
 - control wires select which result ALU outputs

2ⁿ-to-1 Multiplexer

n = 8 for main memory

6.2: Sequential Circuits

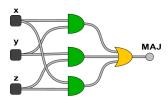

COS 126: General Computer Science • http://www.Princeton.EDU/~cos126

Sequential vs. Combinational Circuits

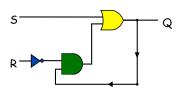

Combinational circuits.

- Output determined solely by inputs.
- Can draw solely with left-to-right signal paths.

Sequential circuits.

- Output determined by inputs AND previous outputs.
- Feedback loop.

31

Flip-Flop

Flip-flop.

- A small and useful sequential circuit.
- Abstraction that "remembers" one bit.
- Basis of important computer components:
 - memory
 - counter

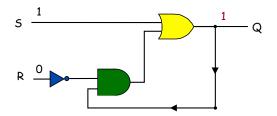

We will consider several flavors.

32

SR Flip-Flop

What is the value of Q if:

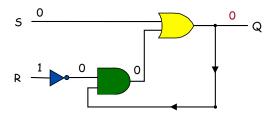

■ S = 1 and R = 0? \Rightarrow Q is surely 1

SR Flip-Flop

What is the value of Q if:

■ S = 1 and R = 0? \Rightarrow Q is surely 1. ■ S = 0 and R = 1? \Rightarrow Q is surely 0

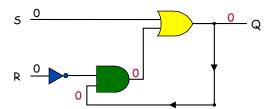

33

SR Flip-Flop

What is the value of Q if:

• S = 1 and R = 0? \Rightarrow Q is surely 1. • S = 0 and R = 1? \Rightarrow Q is surely 0. • S = 0 and R = 0? \Rightarrow Q is possibly 0

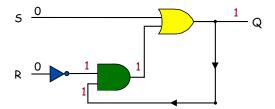

35

37

SR Flip-Flop

What is the value of Q if:

- S = 1 and R = 0? \Rightarrow Q is surely 1. ■ S = 0 and R = 1? \Rightarrow Q is surely 0.
- S = 0 and R = 0? \Rightarrow Q is possibly $0 \dots$ or possibly 1!

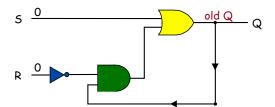

36

SR Flip-Flop

What is the value of Q if:

- S = 1 and R = 0? \Rightarrow Q is surely 1.
- S = 0 and R = 1? $\Rightarrow Q$ is surely 0.
- S = 0 and R = 0? \Rightarrow Q is possibly $0 \dots$ or possibly 1.

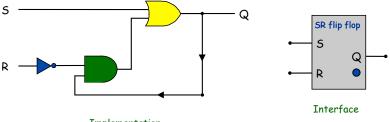

While S = R = 0, Q remembers what it was the last time S or R was 1.

SR Flip-Flop

SR Flip-Flop.

■ S = 1, R = 0 (set) ⇒ "Flips" bit on.
■ S = 0, R = 1 (reset) ⇒ "Flops" bit off.
■ S = R = 0 ⇒ Status quo.
■ S = R = 1 ⇒ Not allowed.

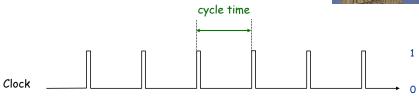

Implementation

Clock

Clock.

- Fundamental abstraction.
 - regular on-off pulse
- External analog device.
- Synchronizes operations of different circuit elements.
- 1 GHz clock means 1 billion pulses per second.

39

How much does it Hert?

Frequency is inverse of cycle time.

- Expressed in hertz.
- Frequency of 1 Hz means that there is 1 cycle per second.
- Hence:
 - 1 kilohertz (kHz) means 1000 cycles/sec.
 - 1 megahertz (MHz) means 1 million cycles/sec.
 - 1 gigahertz (GHz) means 1 billion cycles/sec.
 - 1 terahertz (THz) means 1 trillion cycles/sec.

By the way, no such thing as 1 "hert"!

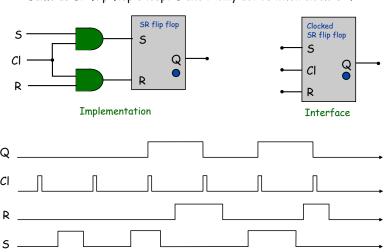

Heinrich Rudolf Hertz (1857-1894)

40

Clocked SR Flip-Flop

Clocked SR Flip-Flop.

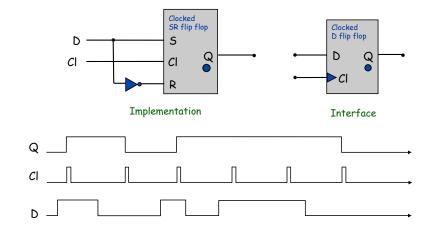

• Same as SR flip-flop except S and R only active when clock is 1.

Clocked D Flip-Flop

Clocked D Flip-Flop.

- Output follows D input while clock is 1.
- Output is remembered while clock is 0.
