Directed graphs

Digraph. Set of vertices connected pairwise by directed edges.

Road network

Vertex = intersection; edge = one-way street.

Political blogosphere graph

Vertex = political blog; edge = link.

The Political Blogosphere and the 2004 U.S. Election: Divided They Blog, Adamic and Glance, 2005

Overnight interbank loan graph

Vertex = bank; edge = overnight loan.

The Topology of the Federal Funds Market, Bech and Atalay, 2008

Uber taxi graph

Vertex = taxi pickup; edge = taxi ride.

Implication graph

Vertex = variable; edge = logical implication.

Combinational circuit

Vertex = logical gate; edge = wire.

WordNet graph

Vertex = synset; edge = hypernym relationship.

Some digraph problems

problem	description	
s→t path	Is there a path from s to t?	
shortest s→t path	What is the shortest path from s to t?	
directed cycle	Is there a directed cycle in the graph ?	
topological sort	Can the digraph be drawn so that all edges point upwards?	
strong connectivity	Is there a directed path between all pairs of vertices ?	
transitive closure	For which vertices v and w is there a directed path from v to w?	
PageRank	What is the importance of a web page ?	

Digraph applications

digraph	vertex	directed edge	
transportation	street intersection	one-way street	
web	web page	hyperlink	
food web	species	predator-prey relationship	
WordNet	synset	hypernym	
scheduling	task	precedence constraint	
financial	bank	transaction	
cell phone	person	placed call	
infectious disease	person	infection	
game	board position	legal move	
citation	journal article	citation	
object graph	object	pointer	
inheritance hierarchy	class	inherits from	
control flow	code block	jump	

Digraph API

Almost identical to Graph API.

public class	Digraph	
	Digraph(int V)	create an empty digraph with V vertices
	Digraph(In in)	create a digraph from input stream
void	addEdge(int v, int w)	add a directed edge $v \rightarrow w$
Iterable <integer></integer>	adj(int v)	vertices pointing from v
int	VO	number of vertices
int	Ε()	number of edges
Digraph	reverse()	reverse of this digraph
String	toString()	string representation

Digraph API

Digraph representation: adjacency lists

Maintain vertex-indexed array of lists.

Digraph representations

In practice. Use adjacency-lists representation.

- Algorithms based on iterating over vertices pointing from v.
- Real-world digraphs tend to be sparse.

representation	space	insert edge from v to w	edge from v to w?	iterate over vertices pointing from v?
list of edges	Ε	1	Е	Е
adjacency matrix	V^2	1†	1	V
adjacency lists	E + V	1	outdegree(v)	outdegree(v)

huge number of vertices,

small average vertex degree

[†] disallows parallel edges

Reachability

Problem. Find all vertices reachable from *s* along a directed path.

Depth-first search in digraphs

Same method as for undirected graphs.

- Every undirected graph is a digraph (with edges in both directions).
- DFS is a digraph algorithm.

DFS (to visit a vertex v)

Mark v as visited. Recursively visit all unmarked vertices w pointing from v.

Depth-first search demo

To visit a vertex *v* :

- Mark vertex *v* as visited.
- Recursively visit all unmarked vertices pointing from v.

Depth-first search (in undirected graphs)

Recall code for undirected graphs.

Reachability application: program control-flow analysis

Every program is a digraph.

- Vertex = basic block of instructions (straight-line program).
- Edge = jump.

Dead-code elimination.

Find (and remove) unreachable code.

Infinite-loop detection.

Determine whether exit is unreachable.

Depth-first search (in directed graphs)

Code for directed graphs identical to undirected one. [substitute Digraph for Graph]

Reachability application: mark-sweep garbage collector

Every data structure is a digraph.

- Vertex = object.
- Edge = reference.

Roots. Objects known to be directly accessible by program (e.g., stack).

Reachable objects. Objects indirectly accessible by program (starting at a root and following a chain of pointers).

Reachability application: mark-sweep garbage collector

Mark-sweep algorithm. [McCarthy, 1960]

- Mark: mark all reachable objects.
- Sweep: if object is unmarked, it is garbage (so add to free list).

Memory cost. Uses 1 extra mark bit per object (plus DFS stack).

Breadth-first search in digraphs

Same method as for undirected graphs.

- Every undirected graph is a digraph (with edges in both directions).
- BFS is a digraph algorithm.

BFS (from source vertex s)

Put s onto a FIFO queue, and mark s as visited. Repeat until the queue is empty:

- remove the least recently added vertex v
- for each unmarked vertex pointing from v: add to queue and mark as visited.

Proposition. BFS computes shortest paths (fewest number of edges) from *s* to all other vertices in a digraph in time proportional to E + V.

Depth-first search in digraphs summary

DFS enables direct solution of simple digraph problems.

- ✓ Reachability.
 - · Path finding.
 - Topological sort.
 - Directed cycle detection.

Basis for solving difficult digraph problems.

- 2-satisfiability.
- Directed Euler path.
- · Strongly-connected components.

SIAM J. COMPUT. Vol. 1, No. 2, June 1972 **DEPTH-FIRST SEARCH AND LINEAR GRAPH ALGORITHMS* ROBERT TARJAN Mostract.** The value of depth-first search or "bacKtracking" as a technique for solving problems is illustrated by two examples. An improved version of an algorithm for finding the biconnected components of a directed graph and an algorithm for finding the biconnected components of an ure cell graph and an algorithm for finding the biconnected components of an ure more constants k₁, k₂, at al k₃, where V is the number of vertices and E is the number of edges of the graph being examined.

Multiple-source shortest paths

Multiple-source shortest paths. Given a digraph and a set of source vertices, find shortest path from any vertex in the set to each other vertex.

Ex. $S = \{ 1, 7, 10 \}.$

- Shortest path to 4 is $7 \rightarrow 6 \rightarrow 4$.
- Shortest path to 5 is $7 \rightarrow 6 \rightarrow 0 \rightarrow 5$.
- Shortest path to 12 is $10 \rightarrow 12$.
- ...

- Q. How to implement multi-source shortest paths algorithm?
- A. Use BFS, but initialize by enqueuing all source vertices.

Breadth-first search in digraphs application: web crawler

Goal. Crawl web, starting from some root web page, say www.princeton.edu.

Solution. [BFS with implicit digraph]

done

- Choose root web page as source *s*.
- Maintain a Queue of websites to explore.
- Maintain a SET of discovered websites.
- Dequeue the next website and enqueue websites to which it links (provided you haven't done so before).

Topological sort in a DAG: intuition

Why does topological sort algorithm work?

- First vertex in postorder has outdegree 0.
- Second-to-last vertex in postorder can only point to last vertex.
- ...

Topological sort in a DAG: correctness proof

Proposition. Reverse DFS postorder of a DAG is a topological order.

- Pf. Consider any edge $v \rightarrow w$. When dfs(v) is called:
- Case 1: dfs(w) has already been called and returned. Thus, w was done before v.
- Case 2: dfs(w) has not yet been called. dfs(w) will get called directly or indirectly by $df_s(v)$ and will finish before $df_s(v)$. Thus, w will be done before v.
- Case 3: dfs(w) has already been called, but has not yet returned. Can't happen in a DAG: function call stack contains path from w to v, so v \rightarrow w would complete a cycle.

Directed cycle detection

Proposition. A digraph has a topological order iff no directed cycle. Pf.

- If directed cycle, topological order impossible.
- If no directed cycle, DFS-based algorithm finds a topological order.

Depth-first search orders

Observation. DFS visits each vertex exactly once. The order in which it does so can be important.

Orderings.

49

- Preorder: order in which dfs() is called.
- Postorder: order in which dfs() returns.
- Reverse postorder: reverse order in which dfs() returns.

private void dfs(Graph G, int v) {
<pre>marked[v] = true;</pre>
<pre>preorder.enqueue(v);</pre>
for (int w : G.adj(v))
<pre>if (!marked[w]) dfs(G, w);</pre>
<pre>postorder.enqueue(v);</pre>
<pre>reversePostorder.push(v);</pre>
}

Strongly-connected components

Def. Vertices *v* and *w* are strongly connected if there is both a directed path from *v* to *w* and a directed path from *w* to *v*.

Key property. Strong connectivity is an equivalence relation:

- *v* is strongly connected to *v*.
- If *v* is strongly connected to *w*, then *w* is strongly connected to *v*.
- If v is strongly connected to w and w to x, then v is strongly connected to x.

Def. A strong component is a maximal subset of strongly-connected vertices.

Algorithms

Connected components vs. strongly-connected components

v and w are connected if there is a path between v and w

v and w are strongly connected if there is both a directed

path from v to w and a directed path from w to v

Strong component application: software modules

Software module dependency graph.

- Vertex = software module.
- Edge: from module to dependency.

Internet Explorer

Strong component. Subset of mutually interacting modules. Approach 1. Package strong components together.

Approach 2. Use to improve design!

Strong component application: ecological food webs

Food web graph. Vertex = species; edge = from producer to consumer.

Strong component. Subset of species with common energy flow.

Strong components algorithms: brief history

1960s: Core OR problem.

- Widely studied; some practical algorithms.
- Complexity not understood.

1972: linear-time DFS algorithm (Tarjan).

- · Classic algorithm.
- Level of difficulty: Algs4++.
- Demonstrated broad applicability and importance of DFS.

1980s: easy two-pass linear-time algorithm (Kosaraju-Sharir).

- Forgot notes for lecture; developed algorithm in order to teach it!
- Later found in Russian scientific literature (1972).

1990s: more easy linear-time algorithms.

- Gabow: fixed old OR algorithm.
- Cheriyan-Mehlhorn: needed one-pass algorithm for LEDA.

Kosaraju-Sharir algorithm: intuition

Reverse graph. Strong components in G are same as in G^R .

Kernel DAG. Contract each strong component into a single vertex.

Idea.

- Compute topological order (reverse postorder) in kernel DAG.
- Run DFS, considering vertices in reverse topological order.

Kosaraju-Sharir algorithm

Proposition. Kosaraju-Sharir algorithm computes the strong components of a digraph in time proportional to E + V.

Pf.

- Running time: bottleneck is running DFS twice (and computing G^R).
- Correctness: tricky, see textbook (2nd printing).
- Implementation: easy!
