The 3D Rasterization Pipeline

COS 426, Spring 2014
Princeton University
3D Rendering Scenarios

- **Batch**
  - One image generated with as much quality as possible for a particular set of rendering parameters
    - Take as much time as is needed (minutes)
    - Useful for photorealism, movies, etc.

- **Interactive**
  - Images generated in fraction of a second (<1/10) with user input, animation, varying camera, etc.
    - Achieve highest quality possible in given time
    - Visualization, games, etc.
3D Polygon Rendering

- Many applications use rendering of 3D polygons with direct illumination
3D Polygon Rendering

- Many applications use rendering of 3D polygons with direct illumination
Ray Casting Revisited

• For each sample …
  ◦ Construct ray from eye position through view plane
  ◦ Find first surface intersected by ray through pixel
  ◦ Compute color of sample based on illumination
3D Polygon Rendering

- We can render polygons faster if we take advantage of spatial coherence
3D Polygon Rendering

- How?
3D Polygon Rendering

• How?
3D Polygon Rendering

• How?
This is a pipelined sequence of operations to draw 3D primitives into a 2D image.
OpenGL executes steps of 3D rendering pipeline for each polygon

```c
glBegin(GL_POLYGON);
glVertex3f(0.0, 0.0, 0.0);
glVertex3f(1.0, 0.0, 0.0);
glVertex3f(0.0, 1.0, 0.0);
glEnd();
```

\[ p'(x',y') \]
Review: Viewing Transformation

- Mapping from world to camera coordinates
  - Eye position maps to origin
  - Right vector maps to X axis
  - Up vector maps to Y axis
  - Back vector maps to Z axis
Review: Camera Coordinates

- Canonical coordinate system
  - Convention is right-handed (looking down -z axis)
  - Convenient for projection, clipping, etc.

![Diagram of camera coordinates]

- Camera right vector maps to X axis
- Camera up vector maps to Y axis
- Camera back vector maps to Z axis (pointing out of page)
Finding the viewing transformation

• We have the camera (in world coordinates)
• We want $T$ taking objects from world to camera

$$p^c = T \ p^w$$

• Trick: find $T^{-1}$ taking objects in camera to world

$$p^w = T^{-1} \ p^c$$

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c & d \\ e & f & g & h \\ i & j & k & l \\ m & n & o & p \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}$$
Finding the Viewing Transformation

• Trick: map from camera coordinates to world
  - Origin maps to eye position
  - Z axis maps to Back vector
  - Y axis maps to Up vector
  - X axis maps to Right vector

\[
\begin{bmatrix}
    x' \\
    y' \\
    z' \\
    w'
\end{bmatrix} =
\begin{bmatrix}
    R_x & U_x & B_x & E_x \\
    R_y & U_y & B_y & E_y \\
    R_z & U_z & B_z & E_z \\
    R_w & U_w & B_w & E_w
\end{bmatrix}
\begin{bmatrix}
    x \\
    y \\
    z \\
    w
\end{bmatrix}
\]

• This matrix is \( T^{-1} \) so we invert it to get \( T \) … easy!

Viewport Transformation

2D Image Coordinates

\[ p'(x', y') \]
Projection

• General definition:
  ◦ Transform points in \( n \)-space to \( m \)-space \((m<n)\)

• In computer graphics:
  ◦ Map 3D camera coordinates to 2D screen coordinates
Taxonomy of Projections

Planar geometric projections

Parallel
- Orthographic
  - Top (plan)
  - Front elevation
  - Side elevation
- Axonometric
  - Isometric
  - Other

Perspective
- Oblique
  - Cabinet
  - Cavalier
  - Other
- One-point
- Two-point
- Three-point

Oblique

Cabinet

One-point

Perspective

Two-point

Three-point

Other

Other
Parallel Projection

- Center of projection is at infinity
  - Direction of projection (DOP) same for all points

View Plane

DOP

Angel Figure 5.4
Orthographic Projections

- DOP perpendicular to view plane
Parallel Projection Matrix

- General parallel projection transformation:

\[
\begin{pmatrix}
1 & 0 & L \cos \phi & 0 \\
0 & 1 & L \sin \phi & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{pmatrix}
\begin{pmatrix}
x_s \\
y_s \\
z_s \\
w_s
\end{pmatrix} =
\begin{pmatrix}
x_c \\
y_c \\
z_c \\
1
\end{pmatrix}
\]

Perspective
Perspective Projection

- Map points onto “view plane” along “projectors” emanating from “center of projection” (COP)
Perspective Projection

- Compute 2D coordinates from 3D coordinates with similar triangles

What are the coordinates of the point resulting from projection of \((x,y,z)\) onto the view plane?
Perspective Projection

• Compute 2D coordinates from 3D coordinates with similar triangles

\[(x_D/z, y_D/z)\]

View Plane

\((0,0,0)\)
Perspective Projection Matrix

- 4x4 matrix representation?

\[
\begin{align*}
x_s &= x_c D / z_c \\
y_s &= y_c D / z_c \\
z_s &= D \\
w_s &= 1
\end{align*}
\]

\[
\begin{bmatrix}
x_s \\
y_s \\
z_s \\
w_s
\end{bmatrix} = \begin{bmatrix}
? & ? & ? & ?
\end{bmatrix} \begin{bmatrix}
x_c \\
y_c \\
z_c \\
1
\end{bmatrix}
\]
Perspective Projection Matrix

• 4x4 matrix representation?

\[
\begin{bmatrix}
  x_s \\
  y_s \\
  z_s \\
  w_s
\end{bmatrix}
= \frac{1}{w'}
\begin{bmatrix}
  ? & ? & ? & ?
\end{bmatrix}
\begin{bmatrix}
  x_c \\
  y_c \\
  z_c \\
  1
\end{bmatrix}
\]

\[
x_s = x_c D / z_c \quad x_s = x' / w' \quad x' = x_c
\]

\[
y_s = y_c D / z_c \quad y_s = y' / w' \quad y' = y_c
\]

\[
z_s = D \quad z_s = z' / w' \quad z' = z_c
\]

\[
w_s = 1 \quad w' = z_c / D
\]
Perspective Projection Matrix

• 4x4 matrix representation?

\[
\begin{bmatrix}
  x_s \\ y_s \\ z_s \\ w_s
\end{bmatrix} =
\begin{bmatrix}
  1 & 0 & 0 & 0 \\
  0 & 1 & 0 & 0 \\
  0 & 0 & 1 & 0 \\
  0 & 0 & 1/D & 0
\end{bmatrix}
\begin{bmatrix}
  x_c \\ y_c \\ z_c \\ 1
\end{bmatrix}
\]

\[
x_s = x_c D / z_c \\
y_s = y_c D / z_c \\
z_s = D \\
w_s = 1
\]

\[
x_s = x'/w' \\
y_s = y'/w' \\
z_s = z'/w' \\
w_s = z_c / D
\]

\[
x' = x_c \\
y' = y_c \\
z' = z_c
\]
Perspective Projection Matrix

- In practice, want to compute a value related to depth to include in visibility calculations.

\[
\begin{align*}
x_s &= x_c \frac{D}{z_c} & x_s &= x' / w' & x' &= x_c \\
y_s &= y_c \frac{D}{z_c} & y_s &= y' / w' & y' &= y_c \\
z_s &= -D / z_c & z_s &= z' / w' & z' &= -1 \\
w_s &= 1 & w' &= z_c / D
\end{align*}
\]

\[
\begin{bmatrix}
x_s \\
y_s \\
z_s \\
w_s
\end{bmatrix} = \begin{bmatrix}
1 & 0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & -1 \\
0 & 0 & 1/D & 0 & 0
\end{bmatrix} \begin{bmatrix}
x_c \\
y_c \\
z_c \\
1
\end{bmatrix}
\]
Perspective vs. Parallel

• Perspective projection
  + Size varies inversely with distance - looks realistic
    – Distance and angles are not (in general) preserved
    – Parallel lines do not (in general) remain parallel

• Parallel projection
  + Good for exact measurements
  + Parallel lines remain parallel
    – Angles are not (in general) preserved
    – Less realistic looking
Transformations map points from one coordinate system to another

\[ \rightarrow \]

2D Screen Coordinates

Viewport Transformation

\[ \rightarrow \]

2D Image Coordinates

\[ p'(x', y') \]
Viewport Transformation

- Transform 2D geometric primitives from screen coordinate system (normalized device coordinates) to image coordinate system (pixels)
Viewport Transformation

• Window-to-viewport mapping

\[
\begin{align*}
  vx &= vx_1 + (wx - wx_1) \times (vx_2 - vx_1) / (wx_2 - wx_1); \\
  vy &= vy_1 + (wy - wy_1) \times (vy_2 - vy_1) / (wy_2 - wy_1);
\end{align*}
\]

Clipping

- Avoid drawing parts of primitives outside window
  - Window defines part of scene being viewed
  - Must draw geometric primitives only inside window
Polygon Clipping

- Find the part of a polygon inside the clip window?

Before Clipping
Polygon Clipping

- Find the part of a polygon inside the clip window?

After Clipping
Sutherland Hodgeman Clipping

• Clip to each window boundary one at a time (for convex polygons)
Sutherland Hodgeman Clipping

- Clip to each window boundary one at a time
Sutherland Hodgeman Clipping

• Clip to each window boundary one at a time
Sutherland Hodgeman Clipping

- Clip to each window boundary one at a time
Sutherland Hodgeman Clipping

- Clip to each window boundary one at a time
Clipping to a Boundary

- Do **inside** test for each point in sequence,
  - Insert new points when cross window boundary,
  - Remove points outside window boundary

Antialiased Scan Conversion
Scan Conversion

• Render an image of a geometric primitive by setting pixel colors

\[
\text{void SetPixel}(\text{int } x, \text{int } y, \text{Color } \text{rgba})
\]

• Example: Filling the inside of a triangle
Triangle Scan Conversion

- Properties of a good algorithm
  - Symmetric
  - Straight edges
  - No cracks between adjacent primitives
  - (Antialiased edges)
  - FAST!
Simple Algorithm

- Color all pixels inside triangle

```c
void ScanTriangle(Triangle T, Color rgba)
{
    for each pixel P in bbox(T)
    {
        if (Inside(T, P))
            SetPixel(P.x, P.y, rgba);
    }
}
```
Triangle Sweep-Line Algorithm

- Take advantage of spatial coherence
  - Compute which pixels are inside using horizontal spans
  - Process horizontal spans in scan-line order

- Take advantage of edge linearity
  - Use edge slopes to update coordinates incrementally
void ScanTriangle(Triangle T, Color rgba) {
    for each edge pair {
        initialize $x_L$, $x_R$;
        compute $dx_L/dy_L$ and $dx_R/dy_R$;
        for each scanline at $y$
            for (int $x = x_L$; $x <= x_R$; $x++$)
                SetPixel($x$, $y$, rgba);
        $x_L += dx_L/dy_L$;
        $x_R += dx_R/dy_R$;
    }
}
void ScanTriangle(Triangle T, Color rgba) {
    for each edge pair {
        initialize \( x_L \), \( x_R \);
        compute \( \frac{dx_L}{dy_L} \) and \( \frac{dx_R}{dy_R} \);
        for each scanline at \( y \) {
            for (int \( x = x_L; x \leq x_R; x++ \))
                SetPixel\((x, y, rgba)\);
            \( x_L += \frac{dx_L}{dy_L} \);
            \( x_R += \frac{dx_R}{dy_R} \);
        }
    }
}
