### Case study: 25 most common words

Find the 25 most common words in a text file, print their frequencies in decreasing order

### A program, "buzz.c"

/\* Enter every word from stdin into a SymTable, bound to its # of occurrences \*/ void readInput (SymTable\_T table);

/\* Make an array of (word, #occ), from the contents of the SymTable \*/ struct counts \*extractCounts( SymTable\_T table);

/\* Sort the "counts" array in descending
order, and print the first 25 entries \*/
void analyzeData(struct counts \*p);

```
/* The main program */
int main(void) {
   SymTable_T table = SymTable_new();
   readInput(table);
   analyzeData(extractCounts(table));
   return 0;
```

# **Reading the input**

enum { $MAX_LEN = 1000$ };

```
int readWord(char *buffer, int buflen) {
 int c;
 /* Skip non-alphabetic characters */
 do {
  c = getchar();
  if (c = EOF) return 0;
 } while (!isalpha(c));
 buffer [0] = ' 0';
 /* Process alphabetic characters */
 while (isalpha(c)) {
  if (strlen(buffer)<buflen-1) {
    buffer[strlen(buffer)+1]='\0';
    buffer[strlen(buffer)]=tolower(c);
  c=getchar();
 buffer[strlen(buffer)] = \sqrt{0};
 return 1;
```

/\* Enter every word from stdin into a SymTable, bound to its # of occurrences \*/ void readInput (SymTable\_T table) { char word[MAX\_LEN+1]; while (readWord(word, MAX\_LEN+1)) { int \*p = (int\*)SymTable\_get( table, word); if (p == NULL) { p = (int\*)malloc(sizeof(int)); \*p = 0;SymTable\_put(table, word, p); (\*p)++;

# **Extracting the counts**

```
struct word_and_count {
   const char *word;
   int count;
};
struct counts {
   int filled;
   int max;
   struct word_and_count *array;
};
```

```
struct counts *makeCounts(int max) {
  struct counts *p =
     (struct counts *) malloc (sizeof (*p));
  assert(p);
  p->filled=0;
  p->max=max;
  p->array = (struct word_and_count*)
     malloc (max * sizeof (struct word_and_count));
  assert (p->array);
  return p;
}
```

void handleBinding( const char \*key, void \*value, void \*extra) { struct counts \*c = (struct counts \*) extra; assert (c->filled < c->max); c->array[c->filled].word = key; c->array[c->filled].count = \*((int\*)value); c->filled += 1; }

```
/* Make an array of (word, #occ), from
    the contents of the SymTable */
struct counts *extractCounts(
        SymTable_T table) {
        struct counts *p = makeCounts(
            SymTable_getLength(table));
        SymTable_map(table,
                handleBinding,
                (void*)p);
    return p;
}
```

# Sorting and printing the counts

/\* Sort the "counts" array in descending order, and print the first 25 entries \*/

```
void analyzeData(struct counts *p) {
    int i, n;
    assert (p->filled == p->max);
    sortCounts(p);
    n = 25<p->max ? 25 : p->max;
    for (i=0; i<n; i++)
        printf("%10d %s\n",
            p->array[i].count,
            p->array[i].word);
```

# **Timing a Program**

Run a tool to time program execution

• E.g., Unix time command

\$ time ./buzz < corpus.txt > output.txt

3.58user 0.00system 0:03.59elapsed 99%CPU

#### **Output:**

- Real (or "elapsed"): Wall-clock time between program invocation and termination
- User: CPU time spent executing the program
- System: CPU time spent within the OS on the program's behalf

In summary: takes 3.58 seconds to process 703,549 characters of input. That's really slow!

(especially if we want to process a whole library of books)

### What should you do?

### The COS 226 answer:

Use asymptotically efficient algorithms and data structures everywhere.

WRONG!

(and, to be fair, that was a **caricature** of the COS 226 answer)

## What should you do?

Caricature of the COS 226 answer:

Use asymptotically efficient algorithms and data structures everywhere.

Most parts of your program won't run on "big data!" Simplicity, maintainability, correctness, easy algorithms and data structures are most important.

### Words of the sages

- "Optimization hinders evolution."
- -- Alan Perlis
- "Premature optimization is the root of all evil."
- -- Donald Knuth
- "Rules of Optimization:
  - Rule 1: Don't do it.
  - Rule 2 (for experts only): Don't do it yet."
- -- Michael A. Jackson\*

### When to Improve Performance

"The first principle of optimization is

Is the program good enough already? Knowing how a program will be used and the environment it runs in, is there any benefit to making it faster?"

-- Kernighan & Pike

### When to Improve Performance

"The first principle of optimization is

The only reason we're even allowed to be here (as good software engineers) is because we did the performance measurement (700k characters in 3.58 seconds) and found it unacceptable.

is there any benefit to making it faster?"

-- Kernighan & Pike

### **Goals of this Lecture**

#### Help you learn about:

- Techniques for improving program performance
  - How to make your programs run faster and/or use less memory
- The oprofile execution profiler

### Why?

- In a large program, typically a small fragment of the code consumes most of the CPU time and/or memory
- A power programmer knows how to identify such code fragments
- A power programmer knows techniques for improving the performance of such code fragments

# **Performance Improvement Pros**

Techniques described in this lecture can yield answers to questions such as:

- How slow is my program?
- Where is my program slow?
- Why is my program slow?
- How can I make my program run faster?
- How can I make my program use less memory?

### Agenda

### **Execution (time) efficiency**

- Do timing studies
- Identify hot spots
- Use a better algorithm or data structure
- Enable compiler speed optimization
- Tune the code

Memory (space) efficiency

## **Timing Parts of a Program**

Call a function to compute wall-clock time consumed

• E.g., Unix gettimeofday() function (time since Jan 1, 1970)

```
#include <sys/time.h>
```

```
struct timeval startTime;
struct timeval endTime;
double wallClockSecondsConsumed;
```

```
gettimeofday(&startTime, NULL);
<execute some code here>
gettimeofday(&endTime, NULL);
wallClockSecondsConsumed =
    endTime.tv_sec - startTime.tv_sec +
    1.0E-6 * (endTime.tv_usec - startTime.tv_usec);
```

# Timing Parts of a Program (cont.)

Call a function to compute **CPU time** consumed

• E.g. clock () function

```
#include <time.h>
clock_t startClock;
clock_t endClock;
double cpuSecondsConsumed;
startClock = clock();
<execute some code here>
endClock = clock();
cpuSecondsConsumed =
   ((double)(endClock - startClock)) / CLOCKS PER SEC;
```

### Agenda

### **Execution (time) efficiency**

- Do timing studies
- Identify hot spots
- Use a better algorithm or data structure
- Enable compiler speed optimization
- Tune the code

Memory (space) efficiency

# **Identifying Hot Spots**

### Gather statistics about your program's execution

- How much time did execution of a particular function take?
- How many times was a particular function called?
- How many times was a particular line of code executed?
- Which lines of code used the most time?
- Etc.

#### How? Use an execution profiler

- Example: gprof (GNU Performance Profiler)
- Reports how many seconds spent in each of your programs' functions, to the nearest millisecond.

# **Identifying Hot Spots**

Gather statistics

- How much
- How mar
- How mai
- Which line
- Etc.

Milliseconds? Really? My whole program runs in a couple of milliseconds! What century do you think we're in?

#### How? Use an execution pro

Example: gprof (GNU Perform)

<sup>5</sup>rofiler)

Reports how many seconds spen in each of your programs' functions, to the nearest millisecond.

# The 1980s just called, they want their profiler back . . .

For some reason, between 1982 and 2016 while computers got 1000x faster, nobody thought to tweak **gprof** to make it report to the nearest microsecond instead of millisecond.

# The 1980s just called, they want their profiler back . . .

So we will use **oprofile**, a 21<sup>st</sup>-century profiling tool. But **gprof** is still available and convenient: what I show here (with **oprofile**) can be done with **gprof**.

Read the man pages:

\$ man gprof
\$ man oprofile

### Using oprofile

#### Step 1: Compile the program with –g and –O2

#### gcc -g -02 -c buzz.c; gcc buzz.o symtablelist.o -o buzz1

-g adds "symbol table" to buzz.o (and the eventual executable) -O2 says "compile with optimizations." If you're worried enough about performance to want to profile, then measure the compiled-for-speed version of the program.

#### Step 2: Run the program

#### operf ./buzz1 < corpus.txt >output

Creates subdirectory oprofile\_data containing statistics

#### Step 3: Create a report

```
opreport -1 -t 1 > myreport
```

• Uses oprofile\_data and buzz's symbol table to create textual report

```
Step 4: Examine the report
```

cat myreport

The oprofile report % of execution time spent in this function					
samples	0 O	image	app name	symbol name	
20871	75.8807	1 <sup>1</sup> / <sub>c</sub> -2.17.so	buzz1	strcmp_sse42	
5732	20.8398	buzz1	buzz1	SymTable_get <u>Nan</u>	ne of
257	0.9344	buzz1	buzz1	SymTable_put the fu	nction
256	0.9307	buzz1	buzz1	ortCounts	incuon
105	0.3817	buzz1	buzz1	reach	
92	0.3345	no-vmlinux	buzz1	/no-vmlin.	
75	0.2727	libc-2.17.so	buzz1	fgetc Nar	ne of
73	0.2654	libc-2.17.so	buzz1	strlen sse2 pmi	
	0.0364	buzz1	buzz1	readInput the ex	ecutable
Name of	0.0327	libc-2.17.so	buzz1		gram /
		libc-2.17.so	buzz1	_int_malloc	0-11-
the binary	.0109	libc-2.17.so	buzz1	ctype_b_loc	
executable	0.0109 ک <mark>ر د</mark>	libc-2.17.so	buzz1	malloc	
	0.0073	libc-2.17.so	buzz1	strcpy_sse2_unaligned	
1	0.0036	buzz1	buzz1	SymTable_map	
1	0.0036	ld-2.17.so	time	bsearch	
1	0.0036	libc-2.17.so	buzz1	malloc_consolidate	
1	0.0036	libc-2.17.so	buzz1	strcpy	
1	0.0036	libc-2.17.so	time	write_nocancel	

I've left out the **-t 1** here; otherwise it would leave out any line whose % is less than 1

### What do we learn from this?

samples	8	image name	app name	symbol name
20871	75.8807	libc-2.17.so	buzz1	strcmp_sse42
5732	20.8398	buzz1	buzz1	SymTable_get
257	0.934	buzz1	buzz1	SymTable_put
256	0.9307	buzz1	buzz1	sortCounts
105	0.3817	vz1	buzz1	readWord
92	0.3345	n linux	buzz1	/no-vmlinux
75	0.2727	lil 17.so	buzz1	fgetc
73	0.2654	libo	luzz1	strlen_sse2_pminub
10	0.0364	by		readInput
9	0.0327	<b>796%</b> of execu	tion time	ctype_tolower_loc
8	0.0291	is in strcmp(	) and in	_int_malloc
3	0.0109			ctype_b_loc
3	0.0109	SymTable_		malloc
2	0.0073	libc-z.		strcpy_sse2_unaligned
1	0.0036	buzz1	buzz1	SymTable_map
1	0.0036	ld-2.17.so	time	bsearch
1	0.0036	libc-2.17.so	buzz1	malloc_consolidate
1	0.0036	libc-2.17.so	buzz1	strcpy
1	0.0036	libc-2.17.so	time	write_nocancel

Who is calling strcmp? Nothing in buzz.c . . . It's the symtablelist.c implementation of SymTable\_get . . .

### Use better algorithms and data structures

Improve the "buzz" program by using

symtablehash.c instead of symtablelist.c

gcc -g -O2 -c buzz.c; gcc buzz.o symtablelist.o -o buzz1

gcc -g -02 -c buzz.c; gcc buzz.o symtablehash.o -o buzz2

Result: execution time decreases from

3.58 seconds to 0.06 seconds

The use of insertion sort instead of quicksort doesn't actually seem to be a problem! That's what we learned from doing the **oprofile**. *This is engineering, not just hacking.* 

### What if 0.06 seconds isn't fast enough?

operf ./buzz2 < corpus.txt >output

opreport -1 -t 1 > myreport

samples	<del>Q</del>	image name	app name	symbol name
221	39.6057	buzz2	buzz2	sortCounts
66	11.8280	buzz2	buzz2	SymTable_get
66	11.8280	libc-2.17.so	buzz2	strlen_sse2_pminub
50	8.9606	buzz2	buzz2	SymTable_hash
45	8.0645	libc-2.17.so	buzz2	fgetc
37	6.6308	buzz2	buzz2	readWord
20	3.5842	libc-2.17.so	buzz2	strcmp_sse42
20	3.5842	no-vmlinux	buzz2	/no-vmlinux

40% of execution time in sortCounts. Let's make it faster.

## Line-by-line view in oprofile

operf ./buzz2 <corpus.txt >output2

opannotate -s > annotated-source2

#### The file annotated-source2:

:/\*-----\*/ :void swap (struct word and count \*a, struct word and count \*b) { : struct word and count t; 87 21.42 : t=\*a; \*a=\*b; \*b=t; :void sortCounts (struct counts \*counts) { : /\* insertion sort \*/ : int i,j; : int n = counts->filled; : struct word and count \*a = counts->array; : for (i=1; i<n; i++)for (j=i; j>0 && a[j-1].count<a[j].count; j--) 81 19.95 swap(a+j, a+j-1);source lines

### **Insertion Sort**

### Quicksort

Use the **qsort** function from the standard library (covered in precept last week)

void sortCounts (struct counts \*counts) {
 qsort(counts->array,
 counts->filled,
 sizeof(struct word\_and\_count),
 compare\_count);

Use quicksort instead of insertion sort

Result: execution time decreases from

0.06 seconds to 0.04 seconds

We could have predicted this! If 40% of the time was in the sort function, and we practically eliminate all of that, then it'll be 40% faster.

Is that fast enough? Well, yes.

But just for fun, let's run the profiler again.

### What if 0.04 seconds isn't fast enough?

samples	S	image name	app name	symbol name
73	27.3408	libc-2.17.so	buzz3	strlen_sse2_pminub
48	17.9775	buzz3	buzz3	readWord
36	13.4831	buzz3	buzz3	SymTable_hash
33	12.3596	libc-2.17.so	buzz3	fgetc
27	10.1124	buzz3	buzz3	SymTable_get
15	5.6180	no-vmlinux	buzz3	/no-vmlinux
11	4.1199	libc-2.17.so	buzz3	strcmp_sse42
4	1.4981	libc-2.17.so	buzz3	
3	1.1236	libc-2.17.so	buzz3	msort_with_t

27% of execution time in strlen(). Who's calling strlen()?

# **Reading the input**

enum {MAX\_LEN = 1000};

int readWord(char \*buffer, int buflen) {
 int c;
 /\* Skip non-alphabetic characters \*/

#### $do \{$

c = getchar(); if (c==EOF) return 0; } while (!isalpha(c));

```
buffer[0]='\0';
/* Process alphabetic cbee
```

```
while (isalpha(c))
if (strlen(buffer)<br/>buffer[strlen(buffer)+1]='\0'
buffer[strlen(buffer)]=to' (c)
```

c=getchar();

```
buffer[strlen(buffer)]='\0';
return 1;
```

This is just silly. We could keep track of the length of the buffer in an integer variable, instead of recomputing each time.

How much faster would the program become?

27% faster; from 0.04 sec to 0.03 sec.

Is it worth it? Perhaps, especially if the program doesn't become harder to read and maintain.

### Agenda

### **Execution (time) efficiency**

- Do timing studies
- Identify hot spots
- Use a better algorithm or data structure
- Enable compiler speed optimization
- Tune the code

Memory (space) efficiency

# **Enabling Speed Optimization**

Enable compiler speed optimization

gcc217 -Ox mysort.c -o mysort

- Compiler spends more time compiling your code so...
- Your code spends less time executing
- x can be:
  - 0: don't optimize
  - 1: optimize (this is the default)
  - 2: optimize more
  - 3: optimize across .c files
- See "man gcc" for details

Beware: Speed optimization can affect debugging

e.g. Optimization eliminates variable  $\Rightarrow$  GDB cannot print value of variable

### Agenda

### **Execution (time) efficiency**

- Do timing studies
- Identify hot spots
- Use a better algorithm or data structure
- Enable compiler speed optimization
- Tune the code

Memory (space) efficiency

# **Avoiding Repeated Computation**

int g(int x)

Avoid repeated computation

Before:

After:

return f(x) + f(x) + f(x) + f(x);

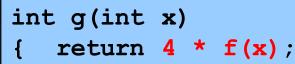

int g(int x)
{ return 4 \* f(x);

Could a good compiler do that for you?

# Aside: Side Effects as Blockers

int g(int x)
{ return f(x) + f(x) + f(x) + f(x);

Q: Could a good compiler do that for you?

A: Probably not

Suppose f() has side effects?

```
int counter = 0;
...
int f(int x)
{ return counter++;
}
```

And **f**() might be defined in another file known only at link time!

# **Avoiding Repeated Computation**

Avoid repeated computation

Before:

for (i = 0; i < strlen(s); i++)
{ /\* Do something with s[i] \*/</pre>

After:

length = strlen(s);
for (i = 0; i < length; i++)
{ /\* Do something with s[i] \*/</pre>

# **Avoiding Repeated Computation**

#### Avoid repeated computation

Before:

After:

### **Tune the Code**

Avoid repeated computation

Before:

void twiddle(int \*p1, int \*p2) { \*p1 += \*p2; \*p1 += \*p2;

After:

{

void twiddle(int \*p1, int \*p2) \*p1 += \*p2 \* 2;

### **Aside: Aliases as Blockers**

void twiddle(int \*p1, int \*p2)
{ \*p1 += \*p2;
 \*p1 += \*p2;
} void t

void twiddle(int \*p1, int \*p2)
{ \*p1 += \*p2 \* 2;
}

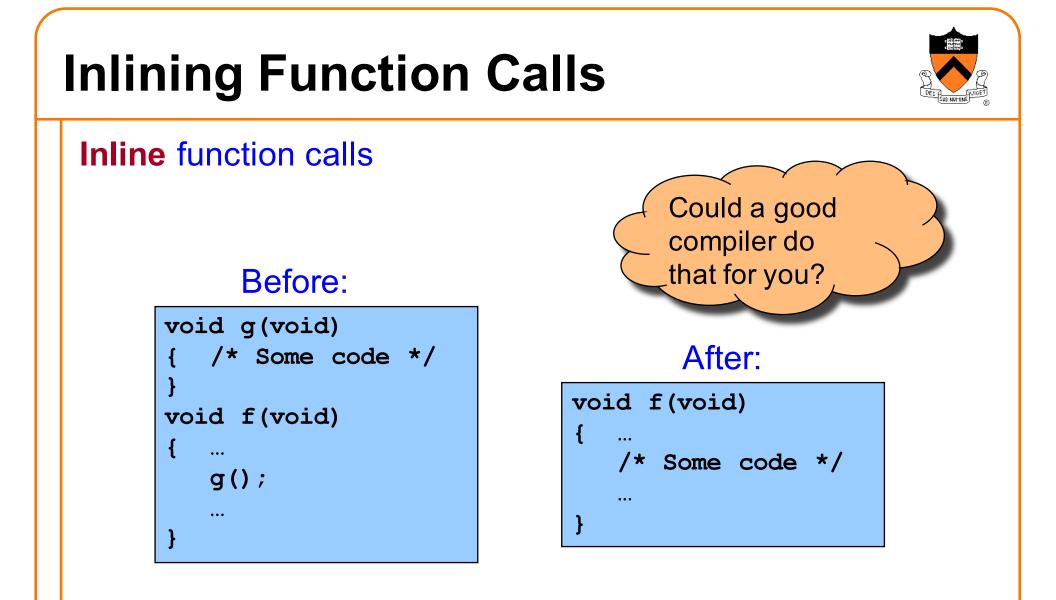

Q: Could a good compiler do that for you?

A: Not necessarily

What if **p1** and **p2** are **aliases**?

- What if **p1** and **p2** point to the same integer?
- First version: result is 4 times \*p1
- Second version: result is 3 times \*p1

Some compilers support restrict keyword

Beware: Can introduce redundant/cloned code Some compilers support inline keyword

# **Unrolling Loops**

#### **Unroll** loops

Original:

for (i = 0; i < 6; i++)
 a[i] = b[i] + c[i];</pre>

Maybe faster:

for (i = 0; i < 6; i += 2)
{ a[i+0] = b[i+0] + c[i+0];
 a[i+1] = b[i+1] + c[i+1];</pre>

Maybe even faster:

a[i+0] = b[i+0] + c[i+0]; a[i+1] = b[i+1] + c[i+1]; a[i+2] = b[i+2] + c[i+2]; a[i+3] = b[i+3] + c[i+3]; a[i+4] = b[i+4] + c[i+4]; a[i+5] = b[i+5] + c[i+5];

Some compilers provide option, e.g. -funroll-loops

# Using a Lower-Level Language

### Rewrite code in a lower-level language

- As described in second half of course...
- Compose key functions in assembly language instead of C
  - Use registers instead of memory
  - Use instructions (e.g. adc) that compiler doesn't know

### Beware: Modern optimizing compilers generate fast code

Hand-written assembly language code could be slower!

### Agenda

### Execution (time) efficiency

- Do timing studies
- Identify hot spots
- Use a better algorithm or data structure
- Enable compiler speed optimization
- Tune the code

### Memory (space) efficiency

# **Improving Memory Efficiency**

These days memory is cheap, so...

Memory (space) efficiency typically is less important than execution (time) efficiency

Techniques to improve memory (space) efficiency...

# **Improving Memory Efficiency**

Use a smaller data type

• E.g. short instead of int

Compute instead of storing

• E.g. To determine linked list length, traverse nodes instead of storing node count

Enable compiler size optimization

• gcc217 -Os mysort.c -o mysort

# Summary

### Steps to improve **execution** (time) efficiency:

- Do timing studies
- Identify hot spots (using oprofile)
- Use a better algorithm or data structure
- Enable compiler speed optimization
- Tune the code

### Techniques to improve **memory** (**space**) efficiency:

- Profile using valgrind
- Use a more efficient data structure (based on evidence from profile)
- Or (in some cases) recompute instead of storing

And, most importantly...

### **Clarity supersedes performance**

# Don't improve performance unless you must!!!
