## 2-3 tree

# Allow 1 or 2 keys per node.

• 2-node: one key, two children.

• 3-node: two keys, three children.

Symmetric order. Inorder traversal yields keys in ascending order.

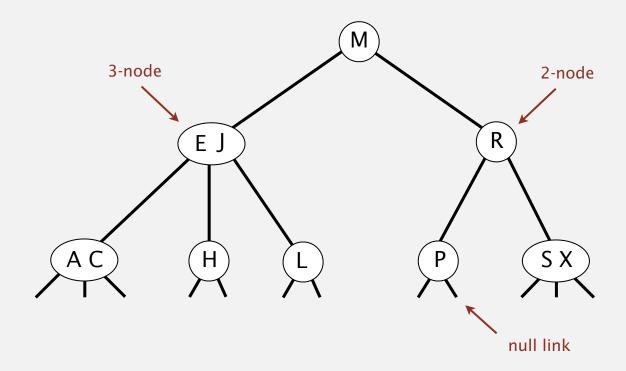

## 2-3 tree

## Allow 1 or 2 keys per node.

• 2-node: one key, two children.

• 3-node: two keys, three children.

Symmetric order. Inorder traversal yields keys in ascending order. Perfect balance. Every path from root to null link has same length.

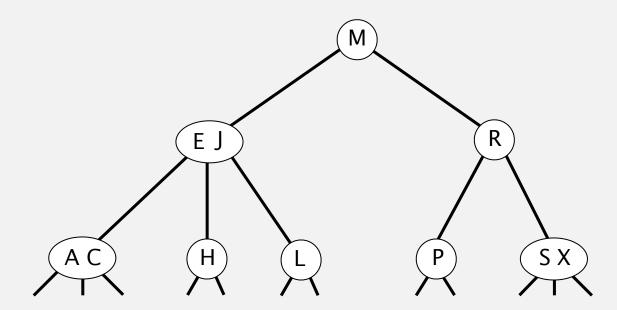

# 2-3 tree demo

# Search.

- Compare search key against keys in node.
- Find interval containing search key.
- Follow associated link (recursively).

#### search for H

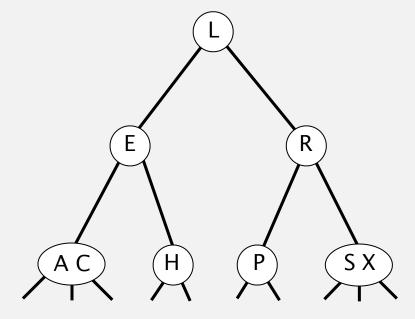

# 2-3 tree demo

#### Insertion into a 3-node at bottom.

- Add new key to 3-node to create temporary 4-node.
- Move middle key in 4-node into parent.
- Repeat up the tree, as necessary.
- If you reach the root and it's a 4-node, split it into three 2-nodes.

#### insert L

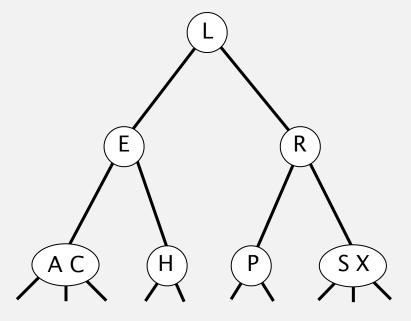

# 2-3 tree construction demo

#### insert S

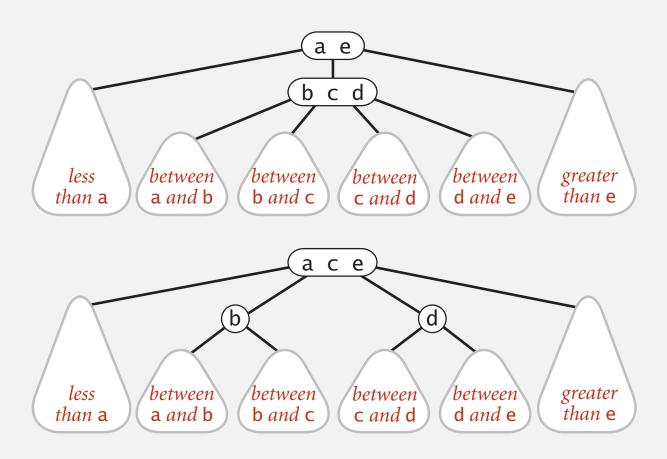

#### 2-3 tree

# Local transformations in a 2-3 tree

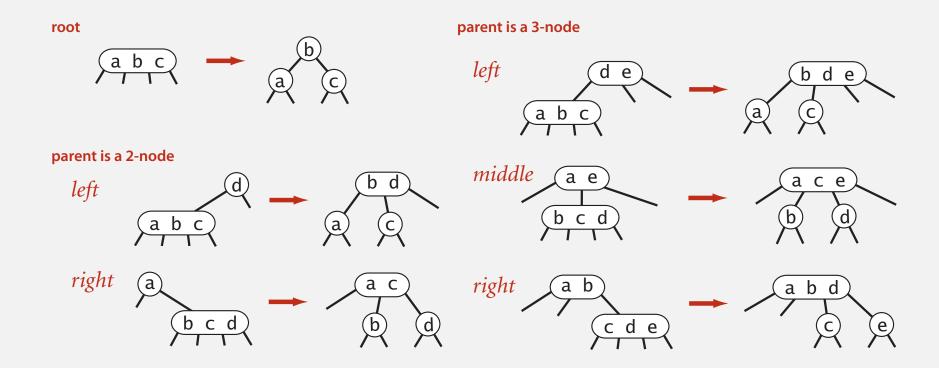

Splitting a 4-node is a local transformation: constant number of operations.

# Global properties in a 2-3 tree

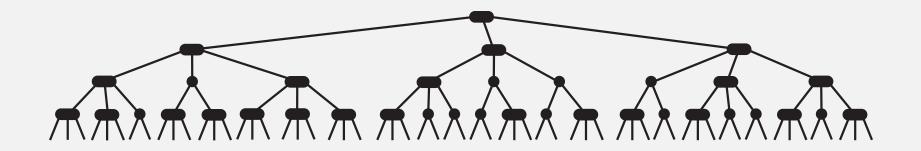

Invariants. Maintains symmetric order and perfect balance.

Pf. Each transformation maintains symmetric order and perfect balance.

# 2-3 tree: performance

Perfect balance. Every path from root to null link has same length.

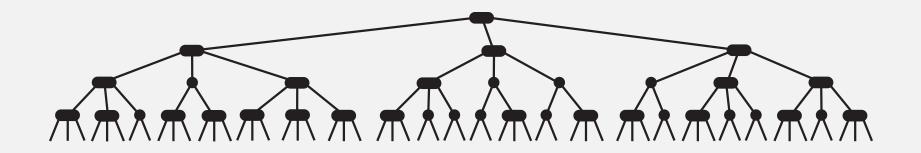

# Tree height.

- Worst case:
- Best case:

# 2-3 tree: performance

Perfect balance. Every path from root to null link has same length.

## Tree height.

- Worst case: lg *N*. [all 2-nodes]
- Best case:  $\log_3 N \approx .631 \lg N$ . [all 3-nodes]
- Between 12 and 20 for a million nodes.
- Between 18 and 30 for a billion nodes.

Guaranteed logarithmic performance for search and insert.

# ST implementations: summary

implementation	worst-case cost (after N inserts)			average case (after N random inserts)			ordered	key
	search	insert	delete	search hit	insert	delete	iteration?	interface
sequential search (unordered list)	N	N	N	N/2	N	N/2	no	equals()
binary search (ordered array)	lg N	N	N	lg N	N/2	N/2	yes	compareTo()
BST	N	N	N	1.39 lg N	1.39 lg N	?	yes	compareTo()
2-3 tree	c lg N	c lg N	c lg N	c lg N	c lg N	c lg N	yes	compareTo()

# 2-3 tree: implementation?

# Direct implementation is complicated, because:

- Maintaining multiple node types is cumbersome.
- Need multiple compares to move down tree.
- Need to move back up the tree to split 4-nodes.
- Large number of cases for splitting.

Bottom line. Could do it, but there's a better way.

# 3.3 BALANCED SEARCH TREES 2-3 search trees red-black BSTs B-frees

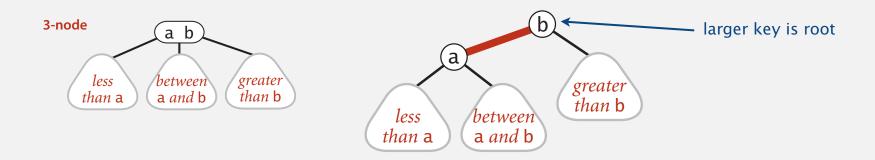

Algorithms

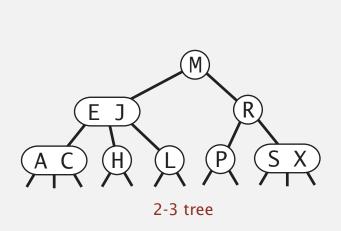

ROBERT SEDGEWICK | KEVIN WAYNE

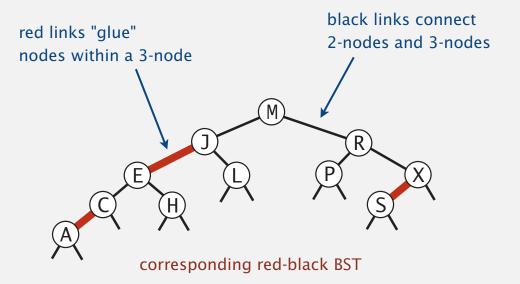

http://algs4.cs.princeton.edu

# Left-leaning red-black BSTs (Guibas-Sedgewick 1979 and Sedgewick 2007)

- 1. Represent 2–3 tree as a BST.
- 2. Use "internal" left-leaning links as "glue" for 3-nodes.

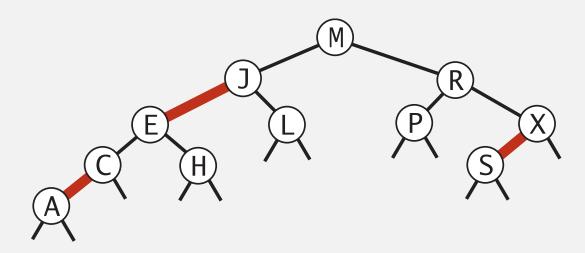

# An equivalent definition

#### A BST such that:

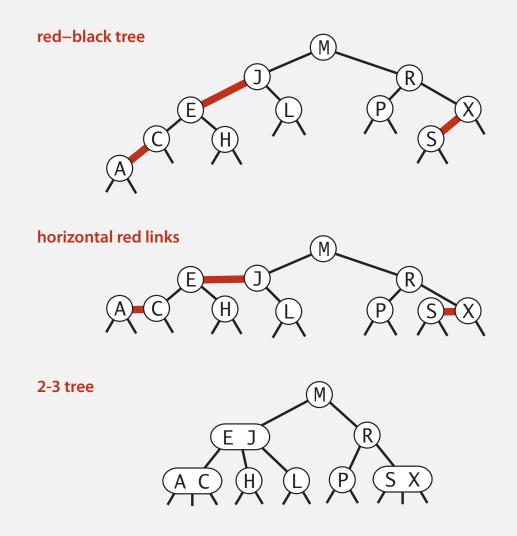

- · No node has two red links connected to it.
- Every path from root to null link has the same number of black links.
- · Red links lean left.

"perfect black balance"

# Left-leaning red-black BSTs: 1-1 correspondence with 2-3 trees

Key property. 1–1 correspondence between 2–3 and LLRB.

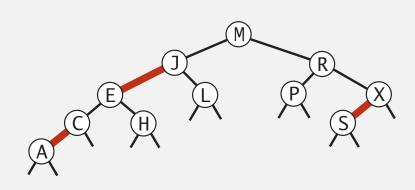

# Search implementation for red-black BSTs

Observation. Search is the same as for elementary BST (ignore color).

but runs faster because of better balance

```
public Val get(Key key)
{
   Node x = root;
   while (x != null)
   {
      int cmp = key.compareTo(x.key);
      if (cmp < 0) x = x.left;
      else if (cmp > 0) x = x.right;
      else if (cmp == 0) return x.val;
   }
   return null;
}
```

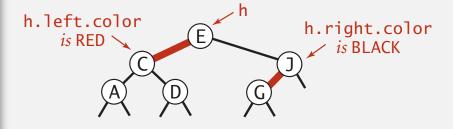

Remark. Most other ops (e.g., floor, iteration, selection) are also identical.

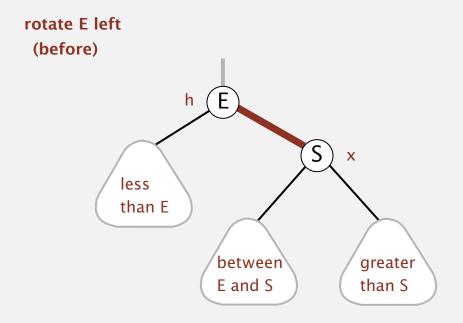

# Red-black BST representation

Each node is pointed to by precisely one link (from its parent)  $\Rightarrow$  can encode color of links in nodes.

```
private static final boolean RED
                                  = true:
private static final boolean BLACK = false;
private class Node
   Key key;
   Value val:
   Node left, right;
   boolean color; // color of parent link
private boolean isRed(Node x)
{
   if (x == null) return false;
   return x.color == RED;
                             null links are black
```

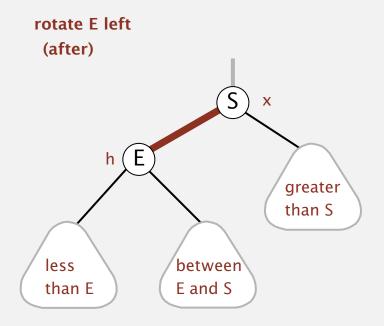

Left rotation. Orient a (temporarily) right-leaning red link to lean left.

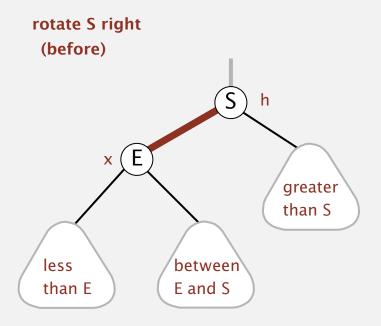

```
private Node rotateLeft(Node h)
{
   assert isRed(h.right);
   Node x = h.right;
   h.right = x.left;
   x.left = h;
   x.color = h.color;
   h.color = RED;
   return x;
}
```

Left rotation. Orient a (temporarily) right-leaning red link to lean left.

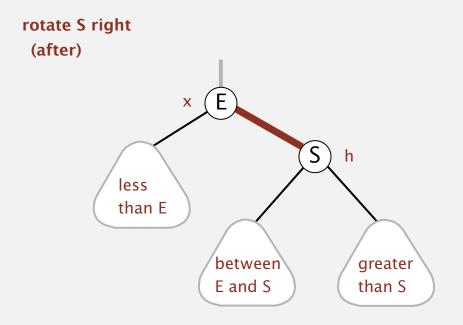

```
private Node rotateLeft(Node h)
{
   assert isRed(h.right);
   Node x = h.right;
   h.right = x.left;
   x.left = h;
   x.color = h.color;
   h.color = RED;
   return x;
}
```

Right rotation. Orient a left-leaning red link to (temporarily) lean right.

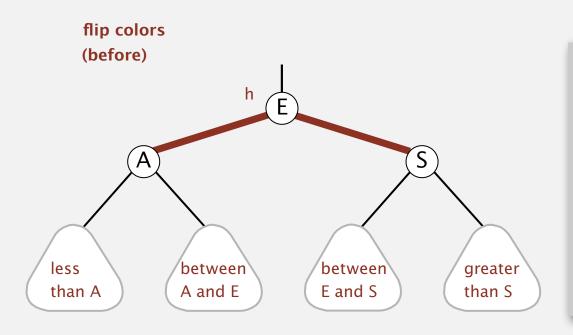

```
private Node rotateRight(Node h)
{
   assert isRed(h.left);
   Node x = h.left;
   h.left = x.right;
   x.right = h;
   x.color = h.color;
   h.color = RED;
   return x;
}
```

Right rotation. Orient a left-leaning red link to (temporarily) lean right.

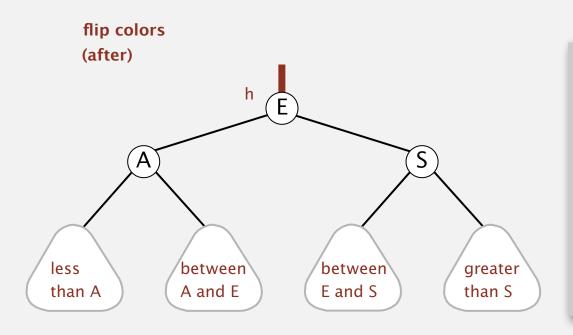

```
private Node rotateRight(Node h)
{
   assert isRed(h.left);
   Node x = h.left;
   h.left = x.right;
   x.right = h;
   x.color = h.color;
   h.color = RED;
   return x;
}
```

Color flip. Recolor to split a (temporary) 4-node.

```
private void flipColors(Node h)
{
    assert !isRed(h);
    assert isRed(h.left);
    assert isRed(h.right);
    h.color = RED;
    h.left.color = BLACK;
    h.right.color = BLACK;
}
```

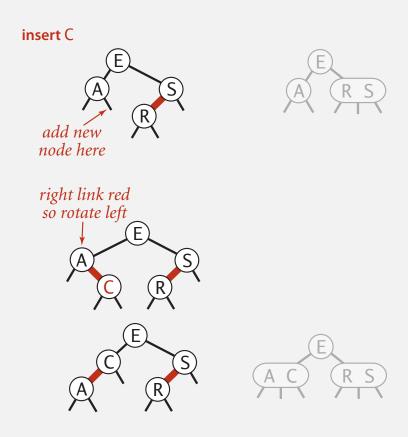

Color flip. Recolor to split a (temporary) 4-node.

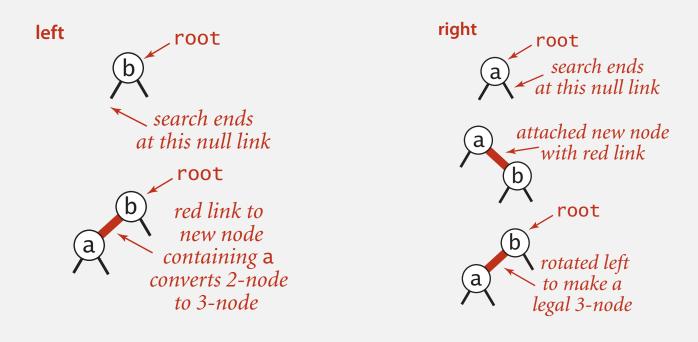

```
private void flipColors(Node h)
{
   assert !isRed(h);
   assert isRed(h.left);
   assert isRed(h.right);
   h.color = RED;
   h.left.color = BLACK;
   h.right.color = BLACK;
}
```

# Insertion in a LLRB tree: overview

Basic strategy. Maintain 1-1 correspondence with 2-3 trees by applying elementary red-black BST operations.

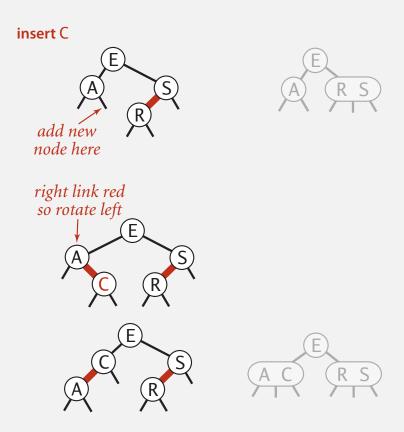

Warmup 1. Insert into a tree with exactly 1 node.

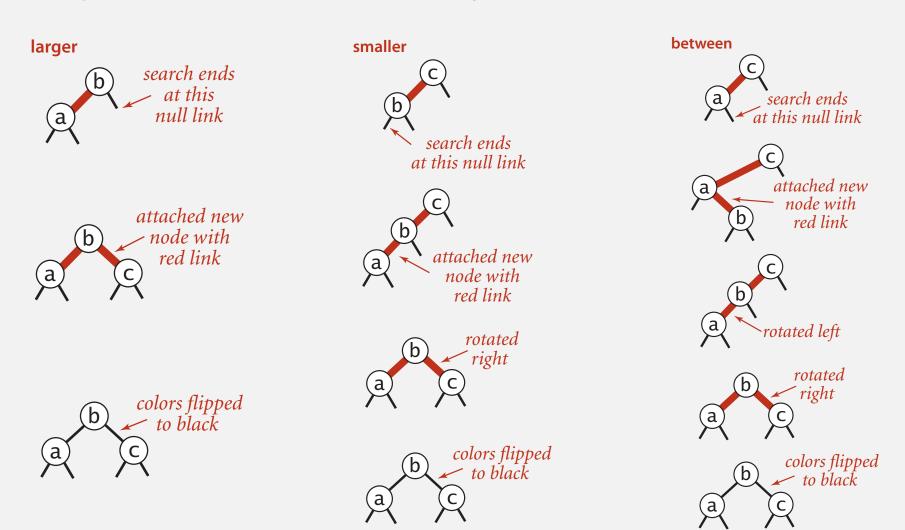

Case 1. Insert into a 2-node at the bottom.

- Do standard BST insert; color new link red.
- If new red link is a right link, rotate left.

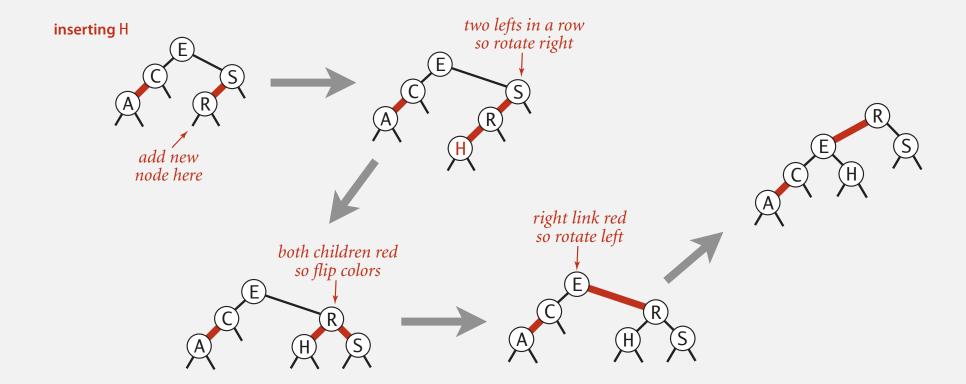

## Warmup 2. Insert into a tree with exactly 2 nodes.

#### Case 2. Insert into a 3-node at the bottom.

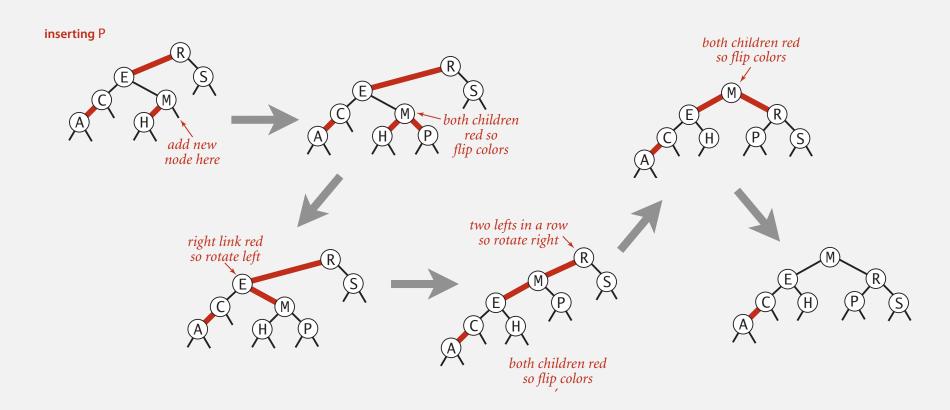

- Do standard BST insert; color new link red.
- Rotate to balance the 4-node (if needed).
- Flip colors to pass red link up one level.
- Rotate to make lean left (if needed).

# Insertion in a LLRB tree: passing red links up the tree

#### Case 2. Insert into a 3-node at the bottom.

- Do standard BST insert; color new link red.
- Rotate to balance the 4-node (if needed).
- Flip colors to pass red link up one level.
- Rotate to make lean left (if needed).
- Repeat case 1 or case 2 up the tree (if needed).

# Red-black BST construction demo

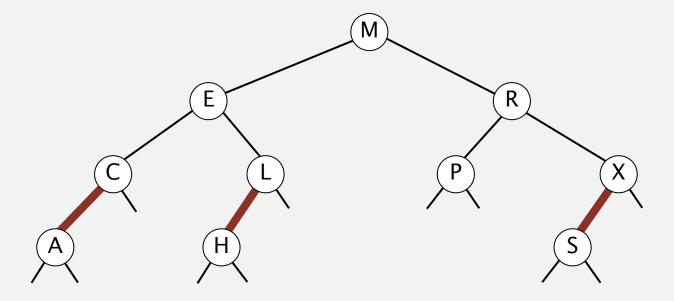

#### insert S

# Red-black BST construction demo

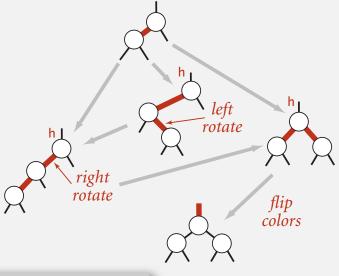

#### red-black BST

### Insertion in a LLRB tree: Java implementation

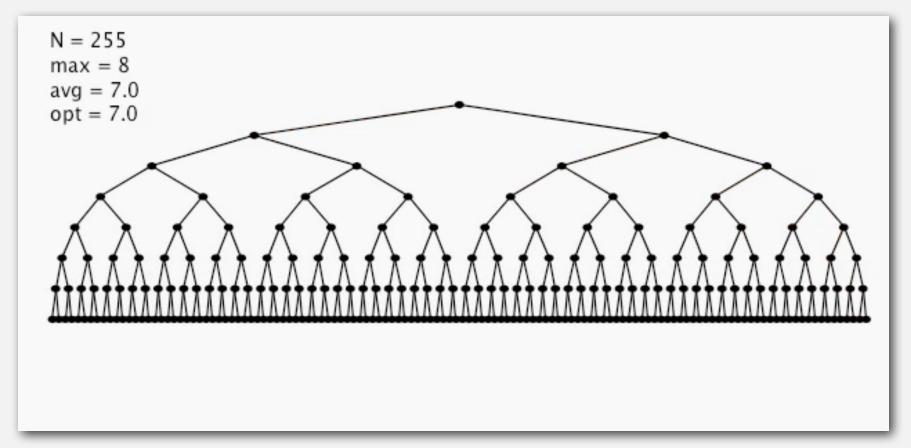

### Same code for all cases.

- Right child red, left child black: rotate left.
- · Left child, left-left grandchild red: rotate right.
- Both children red: flip colors.

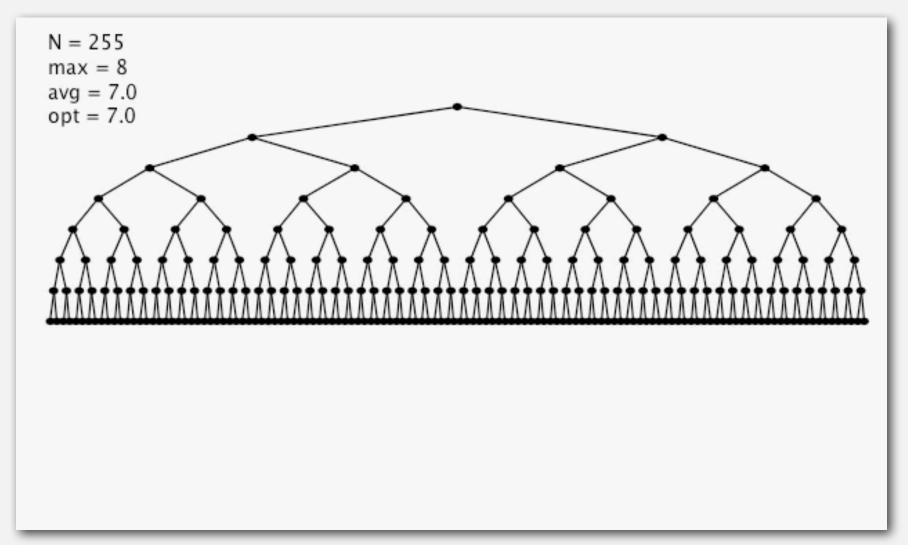

```
private Node put(Node h, Key key, Value val)
                                                                                insert at bottom
   if (h == null) return new Node(key, val, RED);
                                                                                (and color it red)
   int cmp = key.compareTo(h.key);
   if
            (cmp < 0) h.left = put(h.left, key, val);</pre>
   else if (cmp > 0) h.right = put(h.right, key, val);
   else if (cmp == 0) h.val = val;
                                                                               lean left
   if (isRed(h.right) && !isRed(h.left))
                                                 h = rotateLeft(h); \leftarrow
                                                                               balance 4-node
   if (isRed(h.left) && isRed(h.left.left)) h = rotateRight(h);
                                                                               split 4-node
   if (isRed(h.left) && isRed(h.right))
                                                  flipColors(h);
   return h;
                  only a few extra lines of code provides near-perfect balance
```

Carnegie-Mellon University

and

Robert Sedgewick\*
Program in Computer Science
Brown University
Providence, R. I.

### ABSTRACT

In this paper we present a uniform framework for the implementation and study of balanced tree algorithms. We show how to imbed in this the way down towards a leaf. As we will see, this has a number of significant advantages over the older methods. We shall examine a number of variations on a common theme and exhibit full implementations which are notable for their brevity. One implementation is examined carefully, and some properties about its

### War story: red-black BSTs

Telephone company contracted with database provider to build real-time database to store customer information.

### Database implementation.

- Red-black BST search and insert; Hibbard deletion.
- Exceeding height limit of 80 triggered error-recovery process.

allows for up to 240 keys

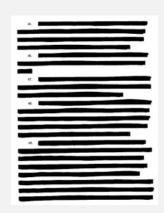

### Extended telephone service outage.

Hibbard deletion was the problem

- Main cause = height bounded exceeded!
- Telephone company sues database provider.
- Legal testimony:

"If implemented properly, the height of a red-black BST with N keys is at most  $2 \lg N$ ." — expert witness

### File system model

Page. Contiguous block of data (e.g., a file or 4,096-byte chunk).

Probe. First access to a page (e.g., from disk to memory).

Property. Time required for a probe is much larger than time to access data within a page.

Cost model. Number of probes.

Goal. Access data using minimum number of probes.

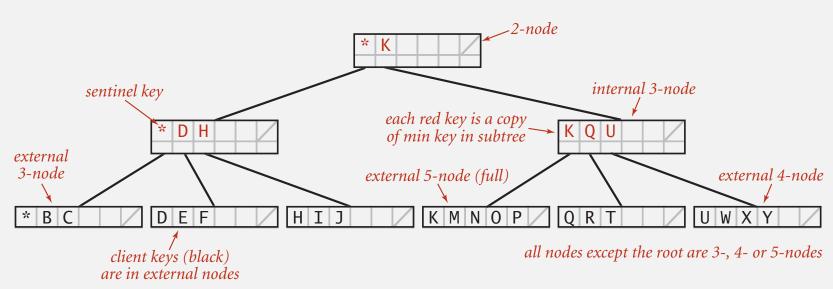

### B-trees (Bayer-McCreight, 1972)

B-tree. Generalize 2-3 trees by allowing up to M-1 key-link pairs per node.

- At least 2 key-link pairs at root.
- At least M/2 key-link pairs in other nodes. that M links fit in a page, e.g., M = 1024

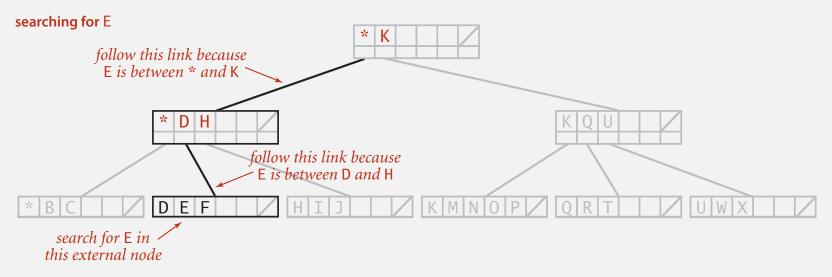

choose M as large as possible so

- External nodes contain client keys.
- Internal nodes contain copies of keys to guide search.

### Searching in a B-tree

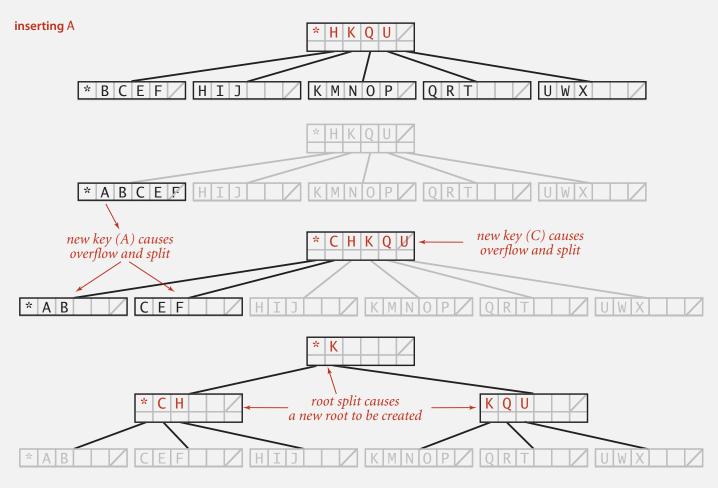

- Start at root.
- Find interval for search key and take corresponding link.
- · Search terminates in external node.

Searching in a B-tree set (M = 6)

### Insertion in a B-tree

- Search for new key.
- Insert at bottom.
- Split nodes with M key-link pairs on the way up the tree.

Inserting a new key into a B-tree set

### Balance in B-tree

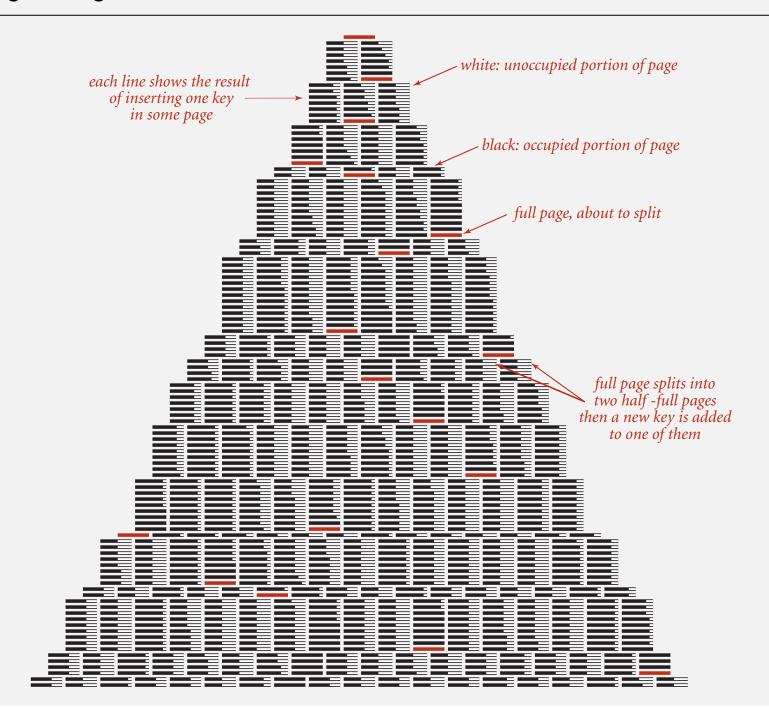

Proposition. A search or an insertion in a B-tree of order M with N keys requires between  $\log_{M-1} N$  and  $\log_{M/2} N$  probes.

Pf. All internal nodes (besides root) have between M/2 and M-1 links.

In practice. Number of probes is at most 4.  $\longleftarrow$  M = 1024; N = 62 billion  $\log_{M/2} N \le 4$ 

Optimization. Always keep root page in memory.

## Building a large B tree

### Balanced trees in the wild

### Red-black trees are widely used as system symbol tables.

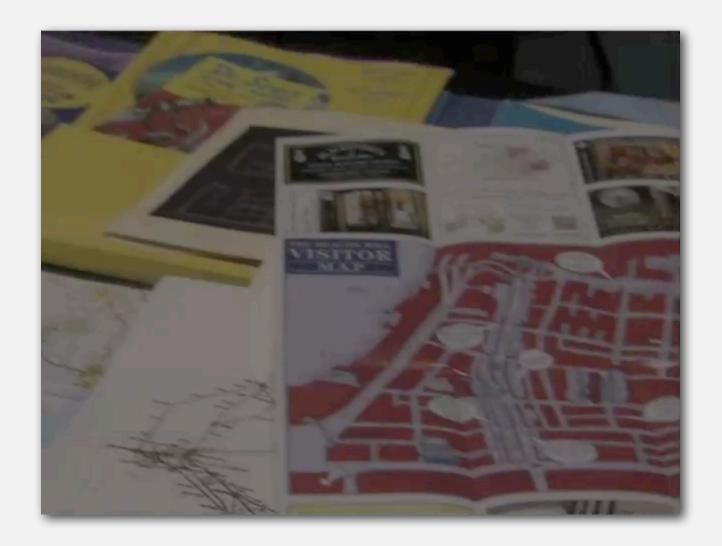

- Java: java.util.TreeMap, java.util.TreeSet.
- C++ STL: map, multimap, multiset.
- Linux kernel: completely fair scheduler, linux/rbtree.h.
- Emacs: conservative stack scanning.

B-tree variants. B+ tree, B\*tree, B# tree, ...

### B-trees (and variants) are widely used for file systems and databases.

- Windows: NTFS.
- Mac: HFS, HFS+.
- Linux: ReiserFS, XFS, Ext3FS, JFS.
- Databases: ORACLE, DB2, INGRES, SQL, PostgreSQL.

## Red-black BSTs in the wild

Common sense. Sixth sense. Together they're the FBI's newest team.

### Red-black BSTs in the wild

### ACT FOUR

FADE IN:

48 INT. FBI HQ - NIGHT

48

Antonio is at THE COMPUTER as Jess explains herself to Nicole and Pollock. The CONFERENCE TABLE is covered with OPEN REFERENCE BOOKS, TOURIST GUIDES, MAPS and REAMS OF PRINTOUTS.

JESS

It was the red door again.

POLLOCK

I thought the red door was the storage container.

JESS

But it wasn't red anymore. It was black.

ANTONIO

So red turning to black means... what?

POLLOCK

Budget deficits? Red ink, black ink?

NICOLE

Yes. I'm sure that's what it is. But maybe we should come up with a couple other options, just in case.

Antonio refers to his COMPUTER SCREEN, which is filled with mathematical equations.

ANTONIO

It could be an algorithm from a binary search tree. A red-black tree tracks every simple path from a node to a descendant leaf with the same number of black nodes.

JESS

Does that help you with girls?
