2. Algorithm Analysis

- computational tractability
- asymptotic order of growth
- implementing Gale–Shapley
- survey of common running times

Models of computation: Turing machines

**Deterministic Turing machine.** Simple and idealistic model.

**Running time.** Number of steps.

**Memory.** Number of tape cells utilized.

**Caveat.** No random access of memory.

- Single-tape TM requires $\geq n^2$ steps to detect $n$-bit palindromes.
- Easy to detect palindromes in $\leq cn$ steps on a real computer.

A strikingly modern thought

"As soon as an Analytic Engine exists, it will necessarily guide the future course of the science. Whenever any result is sought by its aid, the question will arise—By what course of calculation can these results be arrived at by the machine in the shortest time?"

— Charles Babbage (1864)
Models of computation: word RAM

Word RAM.

- Each memory location and input/output cell stores a $w$-bit integer.
- Primitive operations: arithmetic/logic operations, read/write memory, array indexing, following a pointer, conditional branch, ...

Running time. Number of primitive operations.

Memory. Number of memory cells utilized.

Caveat. At times, need more refined model (e.g., multiplying $n$-bit integers).

Polynomial running time

Desirable scaling property. When the input size doubles, the algorithm should slow down by at most some constant factor $C$.

Def. An algorithm is poly-time if the above scaling property holds.

There exist constants $c > 0$ and $d > 0$ such that, for every input of size $n$, the running time of the algorithm is bounded above by $c n^d$ primitive computational steps.

- Assume $w \geq \log_2 n$.
- Constant-time C-style operations ($w = 64$).

Brute force

Brute force. For many nontrivial problems, there is a natural brute-force search algorithm that checks every possible solution.

- Typically takes $2^n$ steps (or worse) for inputs of size $n$.
- Unacceptable in practice.

Polynomial running time

We say that an algorithm is efficient if it has a polynomial running time.

Theory. Definition is (relatively) insensitive to model of computation.

Practice. It really works!

- The poly-time algorithms that people develop have both small constants and small exponents.
- Breaking through the exponential barrier of brute force typically exposes some crucial structure of the problem.

Exceptions. Some poly-time algorithms in the wild have galactic constants and/or huge exponents.

Q. Which would you prefer: $20 n^{1.20}$ or $n^{1 + 0.02 \ln n}$?
Worst-case analysis

Worst case. Running time guarantee for any input of size $n$.

- Generally captures efficiency in practice.
- Draconian view, but hard to find effective alternative.

Exceptions. Some exponential-time algorithms are used widely in practice because the worst-case instances don’t arise.

![Simplex algorithm](image1.png)
![Linux grep](image2.png)
![K-means algorithm](image3.png)

Other types of analyses

Probabilistic. Expected running time of a randomized algorithm.
Ex. The expected number of compares to quicksort $n$ elements is $\sim 2n \ln n$.

Amortized. Worst-case running time for any sequence of $n$ operations.
Ex. Starting from an empty stack, any sequence of $n$ push and pop operations takes $O(n)$ primitive computational steps using a resizing array.

Also. Average-case analysis, smoothed analysis, competitive analysis, ...

Big O notation

Upper bounds. $f(n)$ is $O(g(n))$ if there exist constants $c > 0$ and $n_0 \geq 0$ such that $0 \leq f(n) \leq c \cdot g(n)$ for all $n \geq n_0$.

Ex. $f(n) = 32n^2 + 17n + 1$.

- $f(n)$ is $O(n^2)$. choose $c = 30, n_0 = 1$
- $f(n)$ is neither $O(n)$ nor $O(n \log n)$.

Typical usage. Insertion sort makes $O(n^2)$ compares to sort $n$ elements.
Let \( f(n) = 3n^2 + 17 \log_2 n + 1000 \). Which of the following are true?

A. \( f(n) = O(n^2) \).
B. \( f(n) = O(n^3) \).
C. Both A and B.
D. Neither A nor B.

**Analysis of algorithms: quiz 1**

**Big O notation: properties**

**Reflexivity.** \( f \) is \( O(f) \).

**Constants.** If \( f \) is \( O(g) \) and \( c > 0 \), then \( cf \) is \( O(g) \).

**Products.** If \( f_1 \) is \( O(g_1) \) and \( f_2 \) is \( O(g_2) \), then \( f_1 f_2 \) is \( O(g_1 g_2) \).

**Pf.**

\[ \exists c_1 > 0 \text{ and } n_1 \geq 0 \text{ such that } 0 \leq f_1(n) \leq c_1 \cdot g_1(n) \text{ for all } n \geq n_1, \]

\[ \exists c_2 > 0 \text{ and } n_2 \geq 0 \text{ such that } 0 \leq f_2(n) \leq c_2 \cdot g_2(n) \text{ for all } n \geq n_2, \]

Then, \( 0 \leq f_1(n) \cdot f_2(n) \leq c_1 \cdot c_2 \cdot g_1(n) \cdot g_2(n) \text{ for all } n \geq \max \{ n_1, n_2 \} \).

**Sums.** If \( f_1 \) is \( O(g_1) \) and \( f_2 \) is \( O(g_2) \), then \( f_1 + f_2 \) is \( O(\max \{ g_1, g_2 \}) \).

**Transitivity.** If \( f \) is \( O(g) \) and \( g \) is \( O(h) \), then \( f \) is \( O(h) \).

**Big Omega notation**

**Lower bounds.** \( f(n) \) is \( \Omega(g(n)) \) if there exist constants \( c > 0 \) and \( n_0 \geq 0 \) such that \( f(n) \geq c \cdot g(n) \geq 0 \) for all \( n \geq n_0 \).

**Ex.** \( f(n) = 32n^2 + 17n + 1 \).

\[ \cdot f(n) \text{ is both } \Omega(n^2) \text{ and } \Omega(n). \]

\[ \cdot f(n) \text{ is not } \Omega(n^3). \]

**Typical usage.** Any compare-based sorting algorithm requires \( \Omega(n \log n) \) compares in the worst case.

**Vacuous statement.** Any compare-based sorting algorithm requires at least \( O(n \log n) \) compares in the worst case.
Analysis of algorithms: quiz 2

Which is an equivalent definition of big Omega notation?

A. \( f(n) \) is \( \Omega(g(n)) \) iff \( g(n) \) is \( O(f(n)) \).

B. \( f(n) \) is \( \Omega(g(n)) \) iff there exist constants \( c > 0 \) such that \( f(n) \geq c \cdot g(n) \geq 0 \) for infinitely many \( n \).

C. Both A and B.

D. Neither A nor B.

Analysis of algorithms: quiz 3

Which is an equivalent definition of big Theta notation?

A. \( f(n) \) is \( \Theta(g(n)) \) iff \( f(n) \) is both \( O(g(n)) \) and \( \Omega(g(n)) \).

B. \( f(n) \) is \( \Theta(g(n)) \) iff \( \lim_{n \to \infty} \frac{f(n)}{g(n)} = c \) for some constant \( 0 < c < \infty \).

C. Both A and B.

D. Neither A nor B.

Big Theta notation

Tight bounds. \( f(n) \) is \( \Theta(g(n)) \) if there exist constants \( c_1 > 0, c_2 > 0, \) and \( n_0 \geq 0 \) such that \( 0 \leq c_1 \cdot g(n) \leq f(n) \leq c_2 \cdot g(n) \) for all \( n \geq n_0 \).

Ex. \( f(n) = 32n^2 + 17n + 1 \).

- \( f(n) \) is \( \Theta(n^2) \). \( \leftarrow \) choose \( c_1 = 32, c_2 = 50, n_0 = 1 \)
- \( f(n) \) is neither \( \Theta(n) \) nor \( \Theta(n^3) \).

Typical usage. Mergesort makes \( \Theta(n \log n) \) compares to sort \( n \) elements.

Asymptotic bounds and limits

Proposition. If \( \lim_{n \to \infty} \frac{f(n)}{g(n)} = c \) for some constant \( 0 < c < \infty \) then \( f(n) \) is \( \Theta(g(n)) \).

Pf.

- By definition of the limit, there exists \( n_0 \) such that for all \( n \geq n_0 \)
  \[ \frac{1}{2} c \leq \frac{f(n)}{g(n)} \leq 2c \]

- Multiplying by \( g(n) \) yields \( \frac{1}{2} c \cdot g(n) \leq f(n) \leq 2c \cdot g(n) \) for all \( n \geq n_0 \).
- Thus, \( f(n) \) is \( \Theta(g(n)) \) by definition, with \( c_1 = \frac{1}{2}c \) and \( c_2 = 2c \).

Proposition. If \( \lim_{n \to \infty} \frac{f(n)}{g(n)} = 0 \), then \( f(n) \) is \( O(g(n)) \) but not \( \Theta(g(n)) \).
2. Algorithm Analysis

- Computational tractability
- Asymptotic order of growth
- Implementing Gale–Shapley
- Survey of common running times

## Asymptotic bounds for some common functions

### Polynomials
Let \( f(n) = a_0 + a_1 n + \ldots + a_d n^d \) with \( a_d > 0 \). Then, \( f(n) \) is \( \Theta(n^d) \).

**Pf.**

\[
\lim_{n \to \infty} \frac{a_0 + a_1 n + \ldots + a_d n^d}{n^d} = a_d > 0
\]

### Logarithms
\( \log a \) is \( \Theta(\log_b a) \) for every \( a > 1 \) and every \( b > 1 \).

**Pf.**

\[
\lim_{n \to \infty} \frac{\log a}{\log_b a} = 0
\]

### Exponentials and polynomials
\( n^d \) is \( O(r^n) \) for every \( r > 1 \) and every \( d > 0 \).

**Pf.**

\[
\lim_{n \to \infty} \frac{n^d}{r^n} = 0
\]

### Factorials
\( n! \) is \( 2^{\Theta(n \log n)} \).

**Pf.** Stirling’s formula:

\[
n! \sim \sqrt{2\pi n} \left(\frac{n}{e}\right)^n
\]

## Big O notation with multiple variables

### Upper bounds
\( f(m,n) \) is \( O(g(m,n)) \) if there exist constants \( c > 0, m_0 \geq 0, \) and \( n_0 \geq 0 \) such that \( f(m,n) \leq c \cdot g(m,n) \) for all \( n \geq n_0 \) and \( m \geq m_0 \).

**Ex.**

\( f(m,n) = 32mn^2 + 17mn + 32n^3 \),

- both \( O(mn^2 + n^3) \) and \( O(mn^3) \).
- neither \( O(n^3) \) nor \( O(mn^2) \).

### Typical usage
Breadth-first search takes \( O(m + n) \) time to find a shortest path from \( s \) to \( t \) in a digraph with \( n \) nodes and \( m \) edges.

## Efficient implementation

**Goal.** Implement Gale–Shapley to run in \( O(n^2) \) time.

**Gale–Shapley (preference lists for \( n \) hospitals and \( n \) students)**

**Initialize** \( M \) to empty matching.

**While** (some hospital \( h \) is unmatched)

- \( s \leftarrow \) first student on \( h \)'s list to whom \( h \) has not yet proposed.

  **If** \( s \) is unmatched

    - Add \( h \rightarrow s \) to matching \( M \).

  **Else If** \( s \) prefers \( h \) to current partner \( h' \)

    - Replace \( h' \rightarrow s \) with \( h \rightarrow s \) in matching \( M \).

**Else**

- \( s \) rejects \( h \).

**Return** stable matching \( M \).
Efficient implementation

**Goal.** Implement Gale–Shapley to run in $O(n^2)$ time.

**Representing hospitals and students.** Index hospitals and students $1, \ldots, n$.

**Representing the matching.**
- Maintain two arrays $\text{student}[h]$ and $\text{hospital}[s]$.
  - if $h$ matched to $s$, then $\text{student}[h] = s$ and $\text{hospital}[s] = h$
  - use value 0 to designate that hospital or student is unmatched
- Can add/remove a pair from matching in $O(1)$ time.
- Maintain set of unmatched hospitals in a queue (or stack).
- Can find an unmatched hospital in $O(1)$ time.

---

Data representation: making a proposal

**Hospital makes a proposal.**
- Key operation: find hospital’s next favorite student.
- For each hospital: maintain a list of students, ordered by preference.
- For each hospital: maintain a pointer to student for next proposal.

<table>
<thead>
<tr>
<th>next proposal to</th>
</tr>
</thead>
<tbody>
<tr>
<td>hospital h</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>4</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>5</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>null</td>
</tr>
</tbody>
</table>

**Bottom line.** Making a proposal takes $O(1)$ time.

---

Data representation: accepting/rejecting a proposal

**Student accepts/rejects a proposal.**
- Does student $s$ prefer hospital $h$ to hospital $h'$?
- For each student, create inverse of preference list of hospitals.

$$\begin{align*}
\text{pref}[] & : 8 & 3 & 7 & 1 & 4 & 5 & 6 & 2 \\
\text{rank}[] & : 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 \\
\text{pref}[] & : 8 & 3 & 7 & 1 & 4 & 5 & 6 & 2 \\
\text{rank}[] & : 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 \\
\end{align*}$$

**Bottom line.** After $\Theta(n^2)$ preprocessing time (to create the $n$ ranking arrays), it takes $O(1)$ time to accept/reject a proposal.

---

Stable matching: summary

**Theorem.** Can implement Gale–Shapley to run in $O(n^2)$ time.

**Pf.**
- $\Theta(n^2)$ preprocessing time to create the $n$ ranking arrays.
- There are $O(n^2)$ proposals; processing each proposal takes $O(1)$ time. •

**Theorem.** In the worst case, any algorithm to find a stable matching must query the hospital’s preference list $\Omega(n^2)$ times.
2. **Algorithm Analysis**

- computational tractability
- asymptotic order of growth
- implementing Gale–Shapley
- survey of common running times

**Linear time**

Linear time. Running time is \( O(n) \).

**Merge two sorted lists.** Combine two sorted linked lists \( A = a_1, a_2, \ldots, a_n \) and \( B = b_1, b_2, \ldots, b_n \) into a sorted whole.

**\( O(n) \) algorithm.** Merge in mergesort.

```
i ← 1; j ← 1.
WHILE (both lists are nonempty)
    IF \( a_i \leq b_j \) append \( a_i \) to output list and increment \( i \).
    ELSE append \( b_j \) to output list and increment \( j \).
    Append remaining elements from nonempty list to output list.
```

---

**Constant time**

**Constant time.** Running time is \( O(1) \).

**Examples.**
- Conditional branch.
- Arithmetic/logic operation.
- Declare/initialize a variable.
- Follow a link in a linked list.
- Access element \( i \) in an array.
- Compare/exchange two elements in an array.
- ...
Logarithmic time

Logarithmic time. Running time is $O(\log n)$.

Search in a sorted array. Given a sorted array $A$ of $n$ numbers, is a given number $x$ in the array?

$O(\log n)$ algorithm. Binary search.

- Invariant: If $x$ is in the array, then $x$ is in $A[lo..hi]$.
- After $k$ iterations of WHILE loop, $(hi - lo + 1) \leq n / 2^k \Rightarrow k \leq 1 + \log_2 n$.

\[
\begin{align*}
lo & \leftarrow 1; hi \leftarrow n. \\
\text{WHILE} \ (lo \leq hi) \\
& \quad \quad mid \leftarrow \lfloor (lo + hi) / 2 \rfloor. \\
& \quad \quad \text{IF} \ (x < A[mid]) \ hi \leftarrow mid - 1. \\
& \quad \quad \text{ELSE IF} \ (x > A[mid]) \ lo \leftarrow mid + 1. \\
& \quad \quad \text{ELSE} \ \text{RETURN yes.} \\
& \quad \quad \text{RETURN no.}
\end{align*}
\]

Linearithmic time

Linearithmic time. Running time is $O(n \log n)$.

Sorting. Given an array of $n$ elements, rearrange them in ascending order.

$O(n \log n)$ algorithm. Mergesort.

\[
\begin{array}{cccccccccccccccc}
0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 \\
\text{M} & \text{E} & \text{R} & \text{G} & \text{E} & \text{S} & \text{O} & \text{R} & \text{T} & \text{E} & \text{X} & \text{A} & \text{M} & \text{P} & \text{L} & \text{E}
\end{array}
\]

Search in a sorted rotated array

Search-in-sorted-rotated-array. Given a rotated sorted array of $n$ distinct integers and an element $x$, determine if $x$ is in the array.

Largest empty interval

Largest-empty-interval. Given $n$ timestamps $x_1, \ldots, x_n$ on which copies of a file arrive at a server, what is largest interval when no copies of file arrive?
**Quadratic time**

**Quadratic time.** Running time is \( O(n^2) \).

**Closest pair of points.** Given a list of \( n \) points in the plane \((x_1, y_1), \ldots, (x_n, y_n)\), find the pair that is closest to each other.

**\( O(n^2) \) algorithm.** Enumerate all pairs of points.

\[
\begin{align*}
\min & \leftarrow \infty. \\
\text{FOR } & i = 1 \text{ TO } n \\
\quad & \text{FOR } j = i + 1 \text{ TO } n \\
\quad & \quad d \leftarrow (x_i - x_j)^2 + (y_i - y_j)^2. \\
\quad & \quad \text{IF } (d < \min) \\
\quad & \quad \quad \min \leftarrow d.
\end{align*}
\]

**Remark.** \( \Omega(n^2) \) seems inevitable, but this is just an illusion. [see §5.4]

---

**Cubic time**

**Cubic time.** Running time is \( O(n^3) \).

**3-SUM.** Given an array of \( n \) distinct integers, find three that sum to 0.

**\( O(n^3) \) algorithm.** Enumerate all triples.

\[
\begin{align*}
\text{FOR } & i = 1 \text{ TO } n \\
\quad & \text{FOR } j = i + 1 \text{ TO } n \\
\quad & \quad \text{FOR } k = j + 1 \text{ TO } n \\
\quad & \quad \quad \text{IF } (a_i + a_j + a_k = 0) \\
\quad & \quad \quad \quad \text{RETURN } (a_i, a_j, a_k).
\end{align*}
\]

**Remark.** \( \Omega(n^3) \) seems inevitable, but \( O(n^2) \) is not hard. [see next slide]

---

**3-SUM**

**3-SUM.** Given an array of \( n \) distinct integers, find three that sum to 0.

**\( O(n^3) \) algorithm.**

**\( O(n^2) \) algorithm.**

---

**Polynomial time**

**Polynomial time.** Running time is \( O(n^k) \) for some constant \( k > 0 \).

**Independent set of size \( k \).** Given a graph, find \( k \) nodes such that no two are joined by an edge.

**\( O(n^k) \) algorithm.** Enumerate all subsets of \( k \) nodes.

\[
\text{FOREACH subset } S \text{ of } k \text{ nodes:} \\
\quad \text{Check whether } S \text{ is an independent set.} \\
\quad \text{IF } (S \text{ is an independent set)} \\
\quad \quad \text{RETURN } S.
\]

- Check whether \( S \) is an independent set of size \( k \) takes \( O(k^2) \) time.
- Number of \( k \)-element subsets = \( \binom{n}{k} = \frac{n(n-1)(n-2) \cdots (n-k+1)}{k(k-1)(k-2) \cdots 1} \leq \frac{n^k}{k!} \)
- \( \binom{n}{k} \) poly-time for \( k = 17 \), but not practical
Exponential time

**Exponential time.** Running time is $O(2^k)$ for some constant $k > 0$.

**Independent set.** Given a graph, find independent set of max cardinality.

**$O(n^2 2^n)$ algorithm.** Enumerate all subsets.

```
S* ← ∅.
FOREACH subset $S$ of nodes:
    Check whether $S$ is an independent set.
    IF (S is an independent set and $|S| > |S*|$)
        $S* ← S.$
RETURN $S*$.
```

Analysis of algorithms: quiz 4

Which is an equivalent definition of exponential time?

A. $O(2^n)$

B. $O(2^n)$ for some constant $c > 0$.

C. Both A and B.

D. Neither A nor B.

Analysis of algorithms: quiz 4
doesn’t include $3^n$ includes $3^n$ but doesn’t include $n! = 2^{\Theta(n \log n)}$
