

## Consensus

## Definition:

- 1. A general agreement about something
- 2. An idea or opinion that is shared by all the people in a group

Origin: Latin, from consentire

## Consensus used in systems

Group of servers attempting:

- Make sure all servers in group receive the same updates in the same order as each other
- Maintain own lists (views) on who is a current member of the group, and update lists when somebody leaves/fails
- Elect a leader in group, and inform everybody
- Ensure mutually exclusive (one process at a time only) access to a critical resource like a file

## Paxos: the original consensus protocol

- · Safety
  - Only a single value is chosen
  - Only a proposed value can be chosen
  - Only chosen values are learned by processes
- Liveness \*\*\*
  - Some proposed value eventually chosen if fewer than half of processes fail
  - If value is chosen, a process eventually learns it

# Basic fault-tolerant Replicated State Machine (RSM) approach

- 1. Consensus protocol to elect leader
- 2. 2PC to replicate operations from leader
- 3. All replicas execute ops once committed

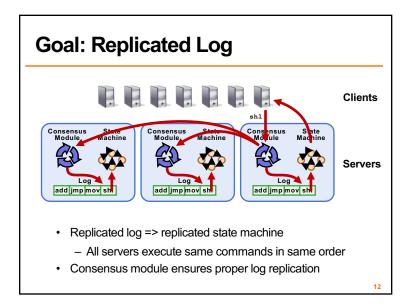

# Why bother with a leader?

Not necessary, but ...

- Decomposition: normal operation vs. leader changes
- · Simplifies normal operation (no conflicts)
- More efficient than leader-less approaches
- Obvious place to handle non-determinism

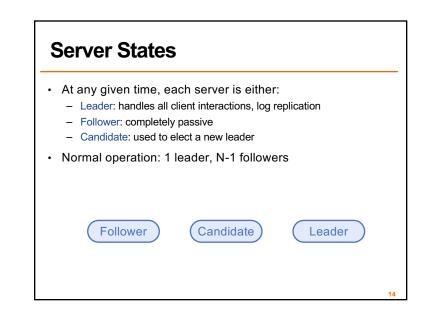

Raft: A Consensus Algorithm for Replicated Logs

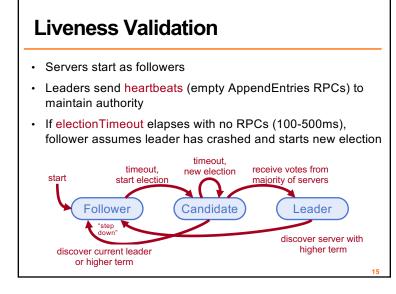

> Diego Ongaro and John Ousterhout Stanford University

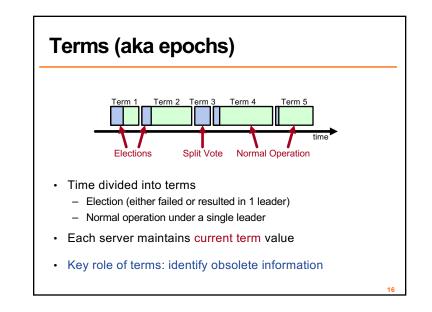

## **Raft Overview**

- 1. Leader election
- 2. Normal operation (basic log replication)
- 3. Safety and consistency after leader changes
- 4. Neutralizing old leaders
- 5. Client interactions
- 6. Reconfiguration

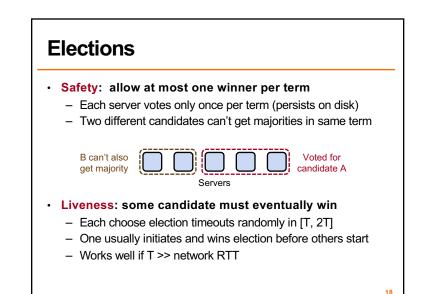

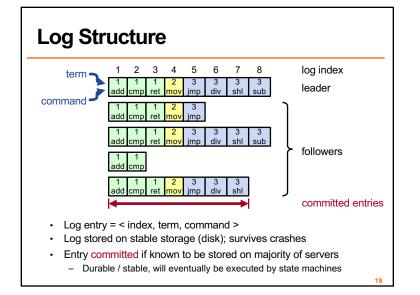

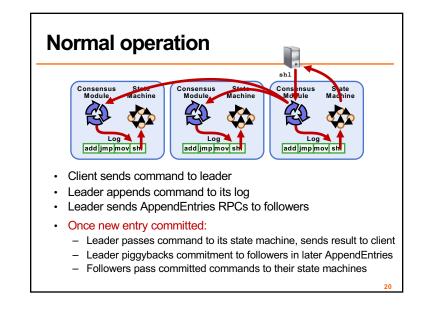

## Elections

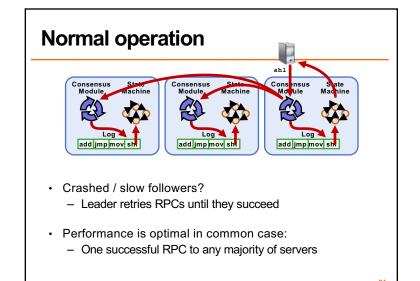

• Start election:

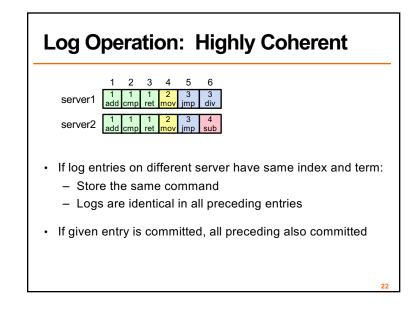

- Increment current term, change to candidate state, vote for self
- Send RequestVote to all other servers, retry until either:
  - 1. Receive votes from majority of servers:
    - Become leader
    - Send AppendEntries heartbeats to all other servers
  - 2. Receive RPC from valid leader:
    - Return to follower state
  - 3. No-one wins election (election timeout elapses):
    - Increment term, start new election

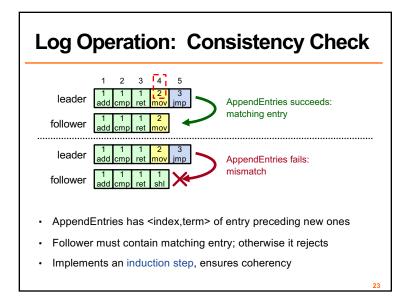

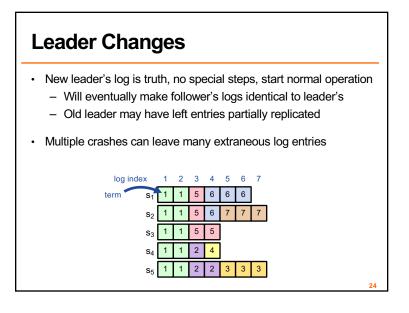

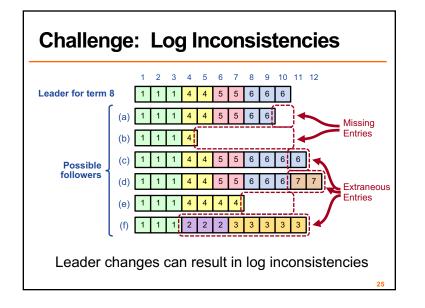

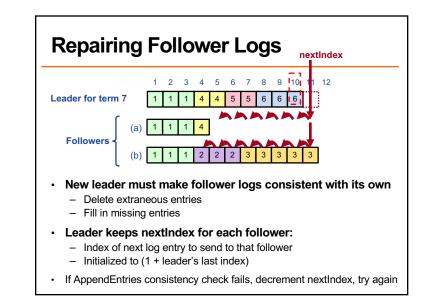

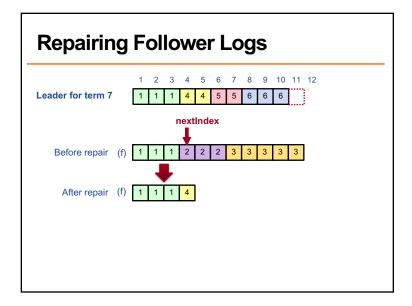

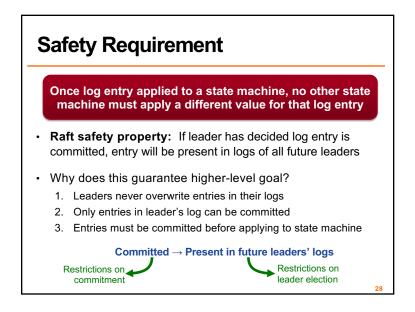

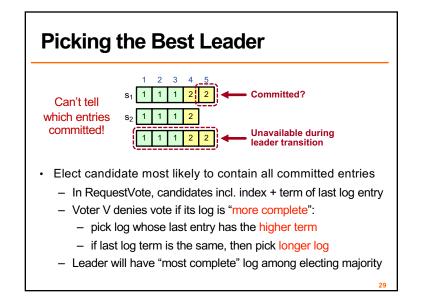

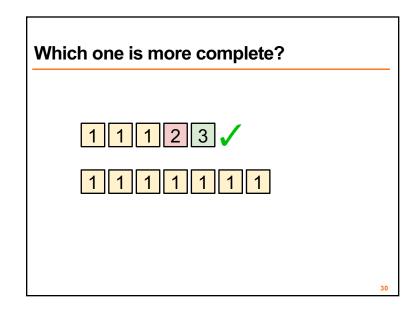

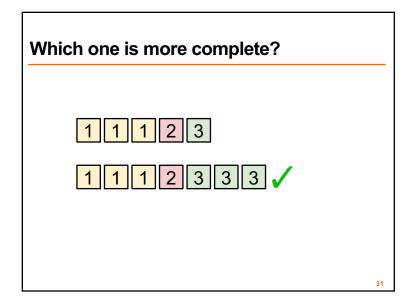

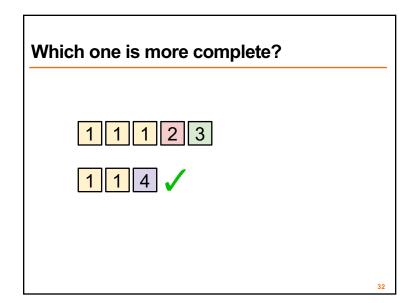

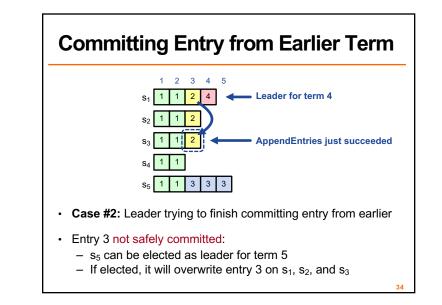

#### 

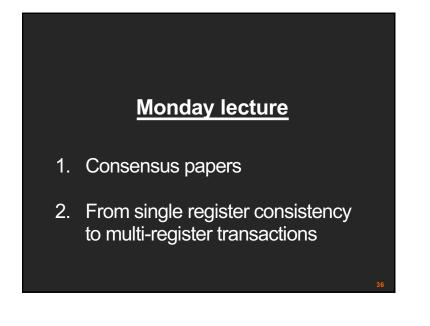

- Case #1: Leader decides entry in current term is committed
- Safe: leader for term 3 must contain entry 4

## Linearizable Reads?

• Not yet...

- 5 nodes: A (leader), B, C, D, E
- A is partitioned from B, C, D, E
- · B is elected as new leader, commits a bunch of ops
- But A still thinks he's the leader = can answer reads
- If a client contacts A, the client will get stale values!
- Fix: Ensure you can contact majority before serving reads
  - ... by committing an extra log entry for each read
  - · This guarantees you are still the rightful leader

38

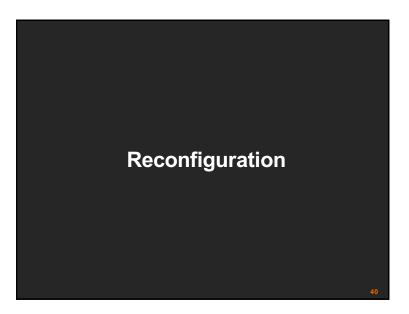

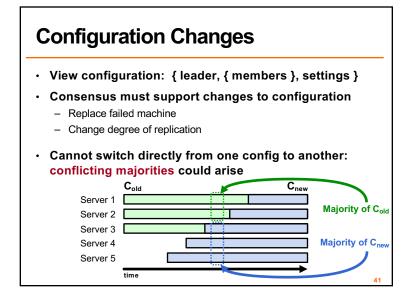

# Neutralizing Old Leaders

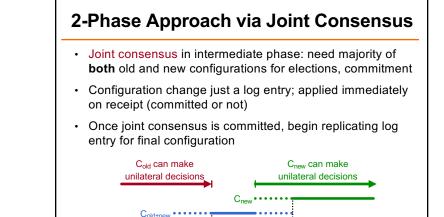

- $\rightarrow$  other servers elect new leader
  - $\rightarrow$  old leader reconnected
    - $\rightarrow$  old leader attempts to commit log entries
- Terms used to detect stale leaders (and candidates)
  - Every RPC contains term of sender
  - Sender's term < receiver:
    - Receiver: Rejects RPC (via ACK which sender processes...)
  - Receiver's term < sender:
    - · Receiver reverts to follower, updates term, processes RPC
- Election updates terms of majority of servers
  - Deposed server cannot commit new log entries

## **Client Protocol**

- Send commands to leader
  - If leader unknown, contact any server, which redirects client to leader
- Leader only responds after command logged, committed, and executed by leader
- If request times out (e.g., leader crashes):
  - Client reissues command to new leader (after possible redirect)
- Ensure exactly-once semantics even with leader failures
  - E.g., Leader can execute command then crash before responding
  - Client should embed unique ID in each command
  - This client ID included in log entry
  - Before accepting request, leader checks log for entry with same id

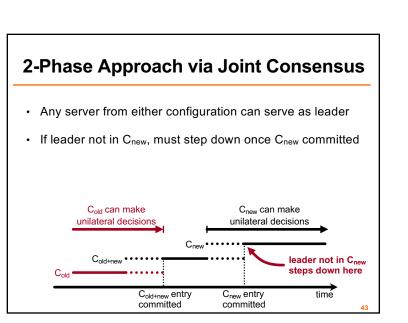

Cold+new entry

committed

Cnew entry

committed

time

42

## Raft vs. VR

## Strong leader

- Log entries flow only from leader to other servers
- Select leader from limited set so doesn't need to "catch up"
- Leader election
  - Randomized timers to initiate elections

## Membership changes

- New joint consensus approach with overlapping majorities
- Cluster can operate normally during configuration changes
