Arrays

**Built-in to C.**
- Declare using `[ ]`.

```c
double a0, a1, a2, a3, a4, a5, a6, a7, a8, a9;
```

vs.

```c
double a[10];
```

- To access element `i` of array named `a`, use `a[i]`.
- **Caveats:**
  - Limitation: need to fix size of array ahead of time.
Array Example: Manipulate Polynomials

\[ p(x) = c_9 x^9 + c_8 x^8 + c_7 x^7 + c_6 x^6 + c_5 x^5 + c_4 x^4 + c_3 x^3 + c_2 x^2 + c_1 x + c_0 \]

C representation of \(1.2x^9 + 3.8x^5 + 7.0\).

```c
int i;
double c[10];
for (i = 0; i < 10; i++)
    c[i] = 0.0;

c[0] = 7.0;
c[5] = 3.8;
c[9] = 1.2;
```

Possible memory representation (assuming array starts at 107).

<table>
<thead>
<tr>
<th>Memory Address</th>
<th>107</th>
<th>108</th>
<th>109</th>
<th>110</th>
<th>111</th>
<th>112</th>
<th>113</th>
<th>114</th>
<th>115</th>
<th>116</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>7.0</td>
<td>0.0</td>
<td>0.0</td>
<td>0.0</td>
<td>0.0</td>
<td>3.8</td>
<td>0.0</td>
<td>0.0</td>
<td>0.0</td>
<td>1.2</td>
</tr>
</tbody>
</table>
Array Example: Manipulate Polynomials

\[
p(x) = c_9 x^9 + c_8 x^8 + c_7 x^7 + c_6 x^6 + c_5 x^5 + c_4 x^4 + c_3 x^3 + c_2 x^2 + c_1 x + c_0
\]

Evaluating \( p(x) \) and \( x = 3.14 \).

```c
double x = 3.14, p = 0.0;
int i;
for (i = 0; i < 10; i++)
    p += c[i] * pow(x, i);
```

Clever alternative (Horner’s method).

```c
double x = 3.14, p = 0.0;
int i;
for (i = 9; i >= 0; i--)
    p += c[i] + (x * p);
```
Array Example: Manipulate Polynomials

\[ p(x) = c_9 x^9 + c_8 x^8 + c_7 x^7 + c_6 x^6 + c_5 x^5 + c_4 x^4 + c_3 x^3 + c_2 x^2 + c_1 x^1 + c_0 \]

Differentiating.

\[ p'(x) = 9c_9 x^8 + 8c_8 x^7 + 7c_7 x^6 + 6c_6 x^5 + 5c_5 x^4 + 4c_4 x^3 + 3c_3 x^2 + 2c_2 x + c_1 \]

double d[10];
int i;
for (i = 0; i < 9; i++)
  d[i] = (i + 1) * c[i + 1];
d[9] = 0.0;
Array Tradeoffs

**Advantage.**

**Disadvantage.**

</table>
Array Example: Strings

A variable of type `char` stores a character.

```c
char c = 'H';
```

A STRING is an array of characters.

```c
char name[20] = "Harold Shapiro";
```

- Implicitly ends with `\0` which is the same as 0.
Benford’s Law

Examine listing of statistical data.
  ● Compute frequency count of LEADING DIGIT.
    – Leading digit of 456789 is 4
  ● Print fraction of occurrences of each digit 1 - 9.
  ● What is distribution?

Use 10-element array count.
  ● $\text{freq}[i]$ counts number of times $i$ is leading digit.
  ● $\text{tot}$ counts total number of items processed.
  ● Print $\left( \frac{\text{freq}[i]}{\text{tot}} \right)$ for each $i$. 
Benford’s Law

```c
#include <stdio.h>

int leadingDigit(int x) {
    while (x >= 10)
        x /= 10;
    return x;
}

int main(void) {
    int i, d, x, tot = 0, freq[10] = {0};
    while (scanf("%d", &x) != EOF) {
        d = leadingDigit(x);
        freq[d]++;
        tot++;
    }
    for (i = 1; i < 10; i++)
        printf("%d: %f\n", i, 1.0 * freq[i] / tot);
    return 0;
}
```
Benford’s Law

Newcomb (1881).
- Tables of logarithms.

Benford (1938).
- River area. Population.
- Newspaper. Specific heat.
- Pressure. Atomic weight.
- Drainage. Reader’s Digest.
- Baseball. Black body.
- Death rates. Addresses.

Scale invariant!

- Distribution of distributions.

```

\[ P_d = \ln \left( \frac{d+1}{d} \right) - \ln 10 \]
Sorting

Goal: given N items, rearrange them in increasing order.

Applications.
- Sort a list of names.
- Find duplicates in a mailing list.
- Find the median.
- Identify statistical outliers.
Insertion Sort

Insertion sort.

- In ith iteration:
  - read ith value
  - repeatedly swap ith value with the one to its left if it is smaller

Property: after ith iteration, array positions 0 through i contain original elements 0 through i in increasing order.

```c
for (i = 0; i < N; i++) {
    for (j = i; j > 0; j--) {
        if (x[j-1] > x[j]) {
            swap = x[j]; x[j] = x[j-1]; x[j-1] = swap;
        }
    }
}
```

Swap x[j] and x[j-1]
```c
#include <stdio.h>
#define N 10

int main(void) {
    int i, j;
    double swap, x[N];

    for (i = 0; i < N; i++)
        scanf("%lf", &x[i]);

    for (i = 0; i < N; i++) {
        for (j = i; j > 0; j--)
            if (x[j-1] > x[j]) {
                swap = x[j]; x[j] = x[j-1]; x[j-1] = swap;
            }
    }

    for (i = 0; i < N; i++)
        printf("%f\n", x[i]);
    return 0;
}
```
Array Function Example: Shuffling

Goal: shuffle n-element array.

- In ith iteration:
  - choose random integer r between 0 and i
  - swap values in positions r and i
- Need random access to arbitrary element ⇒ use arrays.

Property: after i\textsuperscript{th} iteration, array positions 0 through i contain random permutation of elements 0 through i.

```c
void shuffle(double a[], int n) {
    int i, r;
    double swap;
    for (i = 0; i < n; i++) {
        r = randomInteger(i+1);
        swap = a[r]; a[r] = a[i]; a[i] = swap;
    }
}
```
Bicycle Problem

Bicycle problem.

- N kids go to a party and dump bicycle in a pile.
- Kids are blindfolded, and each one selects a bike at random.
- What is likelihood that at least one gets their own bike?

1937 Columbia Superb

1964 Spacelander.

1999 Schwinn Grape Krate
void randomPermutation(int a[], int n) {
    int i;
    for (i = 0; i < n; i++)
        a[i] = i;
    shuffle_int(a, n);
}

randomPermutation()
Bicycle Problem

One simulation:

- Select a random permutation of N elements.
- Check to see if any value matches its index.

```c
#define N 10000
#define TRIALS 1000

int main(void) {
    int i, j, cnt = 0, a[N];

    for (i = 0; i < TRIALS; i++) {
        randomPermutation(a, N);
        for (j = 0; j < N; j++)
            if (a[j] == j) {
                cnt++;
                break;
            }
    }

    printf("successes prob = %f\n",
           1.0 * cnt / TRIALS);
    return 0;
}
```
Bicycle Problem

As N goes to infinitely, what is the probability that at least one kid gets their own bike back?
Lecture P2: Supplemental Notes
All the b variables behave the same. Why not bundle together?

```c
#include <stdio.h>
#define N 100

int main(void) {
    int i, new;
    int b10 = 0, b9 = 1, b8 = 1, b7 = 0, b6 = 1, b5 = 0;
    int b4  = 0, b3 = 0, b2 = 0, b1 = 1, b0 = 0;

    for (i = 0; i < N; i++) {
        new = b3 ^ b10;
        b10 = b9; b9 = b8; b8 = b7; b7 = b6; b6 = b5;
        b5  = b4; b4 = b3; b3 = b2; b2 = b1; b1 = b0; b0 = new;
        printf("%d", new);
    }
    return 0;
}
```
All the b variables behave the same. Why not bundle together?

```c
#include <stdio.h>
#define N   100
#define BITS 10

int main(void) {
    int i, j, new;
    int b[] = {0, 1, 0, 0, 0, 0, 1, 0, 1, 1, 0};

    for (i = 0; i < N; i++) {
        new = b[3] ^ b[10];
        for (j = BITS; j >= 1; j--)
            b[j] = b[j-1];
        b[0] = new;
        printf("%d", new);
    }
    return 0;
}
```
Array Example: Yahtzee

Yahtzee is a "fast-paced, tension-filled game for one or more players" that involves rolling dice. (Milton Bradley)

- Throw five dice. If they all match you yell "YAHTZEE".
- See www.yahtzee.com for other rules.

```c
int dice[5];
int i, match;

for (i = 0; i < 5; i++)
    dice[i] = randomInteger(6) + 1;

match = 1;
for (i = 1; i < 5; i++)
    if (dice[i] != dice[0])
        match = 0;

if (match == 1)
    printf("YAHTZEE!\n");
```
Array Example: Computing a Histogram

Unix

10–19
20–29 **
30–39
40–49
50–59 ******
60–69 *******************
70–79 ******************
80–89 **********
90–99 **
Array Example: Computing a Histogram

Histogram = bar graph of number of occurrences of each value.

- Grades in range 0-99.
- How many in ranges 0-9, 10-19, 20-29, . . ., 90-99?

Can do without arrays with 50+ lines of repetitive code.

Elegant with arrays.

- Use data as index.
- See Program 3.7 in Sedgewick.
Array Example: Computing a Histogram

```c
#include <stdio.h>
int main(void) {
    int i, j, val, bin;
    int h[10];

    for (i = 0; i < 10; i++)
        h[i] = 0;

    while (scanf("%d", &val) != EOF) {
        bin = val / 10;
        h[bin]++;
    }

    for (j = 0; j < 10; j++) {
        printf("%2d-%2d \n", j*10, j*10+9);
        for (i = 0; i < h[j]; i++)
            printf("*");
        printf("\n");
    }

    return 0;
}
```

- initialize array
- calculate which bin
- increment that bin
- print right number of stars for each bin
Array Example: The Birthday Problem

People enter an empty room until a pair of people share a birthday. How long will it take on average?

- Assume birthdays are uniform random integers between 0 and 364.

```c
#define DAYS 365

int bday(void) {
    int i, d, b[DAYS];
    for (i = 0; i < DAYS; i++)
        b[i] = 0;
    for (i = 0; i <= DAYS; i++) {
        d = randomInteger(DAYS);
        if (b[d] == 1)
            return i;
        else
            b[d] = 1;
    }
}
```

- `b[d] = 0` if day `d` not "filled"  
- `b[d] = 1` if day `d` is "filled"

Mark all birthdays as not "filled".

If birthday `d` is "filled" return; o/w as "filled."
Array Example: The Birthday Problem

People enter an empty room until a pair of people share a birthday. How long will it take on average?

- Assume birthdays are uniform random integers between 0 and 364.

```c
#include <stdio.h>
#include <stdlib.h>
#define DAYS   365
#define TRIALS 100

int randomInteger(int n) { ... }
int bday(void) { ... }

int main(void) {
    int i;
    for (i = 0; i < TRIALS; i++)
        printf("%d\n", bday());
    return 0;
}
```
