primitive data types

assignment statements

store and manipulate huge quantities of data
This lecture. Store and manipulate huge quantities of data.

Array. Indexed sequence of values of the same type.

Examples.

• 52 playing cards in a deck.
• 5 thousand undergrads at Princeton.
• 1 million characters in a book.
• 10 million audio samples in an MP3 file.
• 4 billion nucleotides in a DNA strand.
• 73 billion Google queries per year.
• 50 trillion cells in the human body.
• \(6.02 \times 10^{23}\) particles in a mole.

Many Variables of the Same Type

**Goal.** 10 variables of the same type.

// Tedious and error-prone code.

double a0, a1, a2, a3, a4, a5, a6, a7, a8, a9;
a0 = 0.0;
a1 = 0.0;
a2 = 0.0;
a3 = 0.0;
a4 = 0.0;
a5 = 0.0;
a6 = 0.0;
a7 = 0.0;
a8 = 0.0;
a9 = 0.0;
...
a4 = 3.0;
...
a8 = 8.0;
...
double x = a4 + a8;
Many Variables of the Same Type

Goal. 10 variables of the same type.

// Easy alternative.
double[] a = new double[10];
...
a[4] = 3.0;
...
a[8] = 8.0;
...
double x = a[4] + a[8];

declares, creates, and initializes
[stay tuned for details]
Many Variables of the Same Type

Goal. 1 million variables of the same type.

// Scales to handle large arrays.
double[] a = new double[1000000];
...
a[234567] = 3.0;
...
a[876543] = 8.0;
...
double x = a[234567] + a[876543];
Arrays in Java

Java has special language support for arrays.

- To make an array: declare, create, and initialize it.
- To access element $i$ of array named $a$, use $a[i]$.
- Array indices start at 0.

```java
int N = 1000;
double[] a;
a = new double[N];  // declare the array
for (int i = 0; i < N; i++)  // create the array
    a[i] = 0.0;  // initialize the array
    // all to 0.0
```
Arrays in Java

Java has special language support for arrays.

• To make an array: declare, create, and initialize it.

• To access element i of array named a, use a[i].

• Array indices start at 0.

```java
int N = 1000;
double[] a; // declare the array
a = new double[N]; // create the array
for (int i = 0; i < N; i++) // initialize the array
    a[i] = 0.0; // all to 0.0
```

Compact alternatives: Declare, create, and initialize in one statement.

• Default: all entries automatically set to 0.

```java
double[] a = new double[1000];
```

• Initialize to literal values

```java
double[] x = { 0.3, 0.6, 0.1 };
double[] x = new double[3];
x[0] = 0.3; x[1] = 0.6; x[2] = 0.1;
```
Sample Array Code: Vector Dot Product

Dot product. Given two vectors \( x[] \) and \( y[] \) of length \( N \), their dot product is the sum of the products of their corresponding components.

```java
double[] x = { 0.3, 0.6, 0.1 };
double[] y = { 0.5, 0.1, 0.4 };
double sum = 0.0;
for (int i = 0; i < N; i++)
    sum += x[i]*y[i];
```

<table>
<thead>
<tr>
<th>( i )</th>
<th>( x[i] )</th>
<th>( y[i] )</th>
<th>( x[i]*y[i] )</th>
<th>( \text{sum} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.30</td>
<td>0.50</td>
<td>0.15</td>
<td>0.15</td>
</tr>
<tr>
<td>1</td>
<td>0.60</td>
<td>0.10</td>
<td>0.06</td>
<td>0.21</td>
</tr>
<tr>
<td>2</td>
<td>0.10</td>
<td>0.40</td>
<td>0.04</td>
<td>0.25</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0.25</td>
</tr>
</tbody>
</table>
Array Processing Examples

double[] a = new double[N];
for (int i = 0; i < N; i++)
    a[i] = Math.random();
create an array with N random values

for (int i = 0; i < N; i++)
    System.out.println(a[i]);
print the array values, one per line

double[] b = new double[N];
for (int i = 0; i < N; i++)
    b[i] = a[i];
copy to another array

double max = Double.NEGATIVE_INFINITY;
for (int i = 0; i < N; i++)
    if (a[i] > max) max = a[i];
find the maximum of the array values

double sum = 0.0;
for (int i = 0; i < N; i++)
    sum += a[i];
double average = sum / N;
compute the average of the array values

double[] b = new double[N];
for (int i = 0; i < N; i++)
    b[i] = a[i];
copy to another array

for (int i = 0; i < N/2; i++)
    {
        double temp = b[i];
        b[i] = b[N-1-i];
        b[N-i-1] = temp;
    }
reverse the elements within the array
public class Gambler {
    public static void main(String[] args) {
        int stake = Integer.parseInt(args[0]);
        int goal = Integer.parseInt(args[1]);
        int trials = Integer.parseInt(args[2]);

        // ...
    }
}

Mumbo-Jumbo Demystification, Part 1
Shuffling a Deck
Ex. Print a random card.

```java
String[] rank =
{ 
   "2", "3", "4", "5", "6", "7", "8", "9", 
   "10", "Jack", "Queen", "King", "Ace"
} ;

String[] suit = 
{ 
   "Clubs", "Diamonds", "Hearts", "Spades"
} ;

int i = (int) (Math.random() * 13);  // between 0 and 12
int j = (int) (Math.random() * 4);   // between 0 and 3

System.out.println(rank[i] + " of " + suit[j]);
```
Array Challenge 1

The following code sets array values to the 52 card values and prints them. In which order are they printed?

```java
String[] rank = { "2", "3" ... , "King", "Ace" };
String[] suit =
    { "clubs", "diamonds", "hearts", "spades" };

String[] deck = new String[52];
for (int i = 0; i < 13; i++)
    for (int j = 0; j < 4; j++)
        deck[4*i + j] = rank[i] + " of " + suit[j];

for (int i = 0; i < 52; i++)
    System.out.println(deck[i]);
```

A.  2 of clubs
    2 of diamonds
    2 of hearts
    2 of spades
    3 of clubs
    ...
B.  2 of clubs
    3 of clubs
    4 of clubs
    5 of clubs
    6 of clubs
    ...

A.  2 of clubs
    2 of diamonds
    2 of hearts
    2 of spades
    3 of clubs
    ...
B.  2 of clubs
    3 of clubs
    4 of clubs
    5 of clubs
    6 of clubs
    ...
Array Challenge 2

Swap the for statements: rank index in inner loop, suit index in outer loop.

Now, in which order are they printed?

String[] rank = { "2", "3" ... , "King", "Ace" };
String[] suit =
    { "clubs", "diamonds", "hearts", "spades" };

String[] deck = new String[52];
for (int j = 0; j < 4; j++)
    for (int i = 0; i < 13; i++)
        deck[4*i + j] = rank[i] + " of " + suit[j];

for (int i = 0; i < 52; i++)
    System.out.println(deck[i]);

A. 2 of clubs 2 of diamonds 2 of hearts 2 of spades 3 of clubs ...
B. 2 of clubs 3 of clubs 4 of clubs 5 of clubs 6 of clubs ...

these lines swapped from previous slide
Array Challenge 3

The following code sets array values to the 52 card values and prints them. What change to the code will produce the “B” order?

```java
String[] rank = { "2", "3" ...","King", "Ace" };
String[] suit =
    { "clubs", "diamonds", "hearts", "spades" };

String[] deck = new String[52];
for (int i = 0; i < 13; i++)
    for (int j = 0; j < 4; j++)
        deck[4*i + j] = rank[i] + " of " + suit[j];

for (int i = 0; i < 52; i++)
    System.out.println(deck[i]);
```

A. 2 of clubs 2 of diamonds 2 of hearts 2 of spades 3 of clubs ... 
B. 2 of clubs 3 of clubs 4 of clubs 5 of clubs 6 of clubs ...
Shuffling

Goal. Given an array, rearrange its elements in random order.

Shuffling algorithm.

• In iteration $i$, pick random card from $\text{deck}[i]$ through $\text{deck}[N-1]$, with each card equally likely.
• Exchange it with $\text{deck}[i]$.

```java
int N = deck.length;
for (int i = 0; i < N; i++) {
    int r = i + (int) (Math.random() * (N-i));
    String t = deck[r];
    deck[r] = deck[i];
    deck[i] = t;
}
```
Shuffle a deck of cards.

- In $i^{th}$ iteration, put a random element from remainder of deck at index $i$.
  - choose random integer $r$ between $i$ and $N-1$
  - swap values in positions $r$ and $i$

Coupon Collector
Coupon collector problem. Given $N$ different card types, how many do you have to collect before you have (at least) one of each type?

Simulation algorithm. Repeatedly choose an integer $i$ between 0 and $N-1$. Stop when we have at least one card of every type.

Q. How to check if we've seen a card of type $i$?
A. Maintain a boolean array so that $\text{found}[i]$ is true if we've already collected a card of type $i$. 

assuming each possibility is equally likely for each card that you collect
public class CouponCollector {
    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        int cardcnt = 0; // number of cards collected
        int valcnt = 0;  // number of distinct cards

        // Do simulation.
        boolean[] found = new boolean[N];
        while (valcnt < N) {
            int val = (int) (Math.random() * N);
            cardcnt++;
            if (!found[val]) {
                valcnt++;
                found[val] = true;
            }
        }

        // all N distinct cards found
        System.out.println(cardcnt);
    }
}
# Coupon Collector: Debugging

**Debugging.** Add code to print contents of all variables.

**Challenge.** Debugging with arrays requires tracing many variables.
**Coupon Collector: Mathematical Context**

**Coupon collector problem.** Given $N$ different possible cards, how many do you have to collect before you have (at least) one of each type?

**Fact.** About $N (1 + 1/2 + 1/3 + \ldots + 1/N) \sim N \ln N$

see ORF 245 or COS 341

**Ex.** $N = 30$ baseball teams. Expect to wait $\approx 120$ years before all teams win a World Series.

under idealized assumptions
Q. Given a sequence from nature, does it have same characteristics as a random sequence?

A. No easy answer - many tests have been developed.

**Coupon collector test.** Compare number of elements that need to be examined before all values are found against the corresponding answer for a random sequence.
Multidimensional Arrays
Two Dimensional Arrays

Two dimensional arrays.
- Table of data for each experiment and outcome.
- Table of grades for each student and assignments.
- Table of grayscale values for each pixel in a 2D image.

Mathematical abstraction. Matrix.
Java abstraction. 2D array.

Reference: Botstein & Brown group
Two Dimensional Arrays in Java

Declare, create, initialize. Like 1D, but add another pair of brackets.

```
int M = 10;
int N = 3;
double[][] a = new double[M][N];
```

Array access.

Use `a[i][j]` to access entry in row `i` and column `j`.

Indices start at 0.

Initialize.

This code is implicit (sets all entries to 0).

```
for (int i = 0; i < M; i++)
  for (int j = 0; j < N; j++)
    a[i][j] = 0.0;
```

Warning. This implicit code might slow down your program for big arrays.
Setting 2D Array Values at Compile Time

Initialize 2D array by listing values.

double[][] p =
{
    { .02, .92, .02, .02, .02 },
    { .02, .02, .32, .32, .32 },
    { .02, .02, .02, .92, .02 },
    { .92, .02, .02, .02, .02 },
    { .47, .02, .47, .02, .02 },
};
Matrix addition. Given two N-by-N matrices `a` and `b`, define `c` to be the N-by-N matrix where `c[i][j]` is the sum `a[i][j] + b[i][j].`
Matrix multiplication. Given two N-by-N matrices $a$ and $b$, define $c$ to be the N-by-N matrix where $c[i][j]$ is the dot product of the $i^{th}$ row of $a$ and the $j^{th}$ row of $b$.

```java
double[][] c = new double[N][N];
for (int i = 0; i < N; i++)
    for (int j = 0; j < N; j++)
        for (int k = 0; k < N; k++)
            c[i][j] += a[i][k] * b[k][j];
```
How many multiplications to multiply two N-by-N matrices?

double[][] c = new double[N][N];
for (int i = 0; i < N; i++)
    for (int j = 0; j < N; j++)
        for (int k = 0; k < N; k++)
            c[i][j] += a[i][k] * b[k][j];

A. N
B. N²
C. N³
D. N⁴
Application: 2D Random Walks
Application: Self-Avoiding Walks
Self-Avoiding Walk

Model.

• N-by-N lattice.
• Start in the middle.
• Randomly move to a neighboring intersection, avoiding all previously visited intersections.
• Two possible outcomes: escape and dead end

Applications. Polymers, statistical mechanics, etc.

Q. What fraction of time will you escape in an 5-by-5 lattice?
Q. In an N-by-N lattice?
Q. In an N-by-N-by-N lattice?
public class SelfAvoidingWalk
{
    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);  // lattice size
        int T = Integer.parseInt(args[1]);   // number of trials
        int deadEnds = 0;                    // trials ending at dead end

        for (each trial )
        {
            boolean[][] a = new boolean[N][N];  // intersections visited
            int x = N/2, y = N/2;                // current position

            while (you’re still inside the lattice )
            {
                if (you’re at a dead end )
                {
                    deadEnds++;  break; }

                a[x][y] = true;                    // mark as visited

                double r = Math.random();
                if   (r < 0.25) { if (!a[x+1][y]) x++; }

Summary

Arrays.
- Organized way to store huge quantities of data.
- Almost as easy to use as primitive types.
- Can directly access an element given its index.

Caveats:
- Need to fix size of array ahead of time.
- Don't forget to allocate memory with `new`.
- Indices start at 0 not 1.
- Out-of-bounds to access `a[-1]` or `a[N]` of N element array.
  - in Java: `ArrayIndexOutOfBoundsException`
  - in C: "ghastly error"

Ahead. Reading in large quantities of data from a file into an array.
"You're always off by 1 in this business." - J. Morris

Man, you're being inconsistent with your array indices. Some are from one, some from zero.

Different tasks call for different conventions. To quote Stanford algorithms expert Donald Knuth, "Who are you? How did you get in my house?"

Wait, what?

Well, that's what he said when I asked him about it.
