

### 3. Object Oriented Programming

Introduction to Computer Science • Robert Sedgewick and Kevin Wayne • <http://www.cs.Princeton.EDU/IntroCS>

#### Objects

**Object.** Holds a data type value; variable name refers to object.

**Impact.** Enables us to create our own data types; define operations on them; and integrate into our programs.

Data Type	Set of Values	Operations
Color	24 bits	get red component, brighten
Picture	2D array of colors	get/set color of pixel (i, j)
String	sequence of characters	length, substring, get ith char

To construct a new object: Use keyword `new` and name of data type.

To apply an operation: Use name of object, the **dot operator**, and the name of the **method**.

```
String s = new String("Hello");
int N    = s.length();
String t = s.substring(2, 4);
```

#### Data Types

**Data type.** Set of values and operations on those values.

**Java has 8 primitive types.**

- Language support for common operations: `+ - * / % && || !`
- `boolean, char, int, byte, short, long, float, double`

Data Type	Set of Values	Built-In Operations
<code>boolean</code>	<code>true, false</code>	<code>not, and, or, xor</code>
<code>int</code>	any of $2^{32}$ possible integers	<code>add, subtract, multiply</code>
<code>double</code>	any of $2^{64}$ possible reals	<code>add, subtract, multiply</code>

We want to write programs that process other types of data.

- Colors, pictures, strings, input streams.
- Complex numbers, matrices, rational numbers, polynomials, ...
- Points, lines, rectangles, circles, spheres, ...

2

### 3.1. Using Data Types

## Colors

**Color.** A sensation in the eye from electromagnetic radiation.

**Set of values (RGB representation):** 256<sup>3</sup> possible values, which quantify the amount of red, green, and blue, each on a scale of 0 to 255.

R	G	B	Color
255	0	0	Red
0	255	0	Green
0	0	255	Blue
255	255	255	White
0	0	0	Black
255	0	255	Magenta
105	105	105	Grey

## Colors

**Color.** A sensation in the eye from electromagnetic radiation.

**Set of values (RGB representation):** 256<sup>3</sup> possible values, which quantify the amount of red, green, and blue, each on a scale of 0 to 255.

**Operations (partial):** for Color variable c.

Operation	Description	Return type
c.getRed()	return red component	int
c.getGreen()	return green component	int
c.getBlue()	return blue component	int
c.brighter()	return brighter version of c	Color
c.darker()	return darker version of c	Color
c.toString()	return string representation of c	String

Reference: <http://java.sun.com/j2se/1.4.2/docs/api/java.awt/Color.html>

5

6

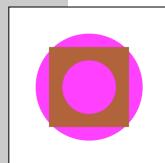

## Using Colors in Java

**One use of objects.** Store aggregate data in one variable.

use import to access Java library

```
import java.awt.Color;

public class ColorTest {
    public static void main(String[] args) {
        StdDraw.create(600, 600);
        Color magenta = new Color(255, 0, 255);
        Color sienna = new Color(160, 82, 45);
        StdDraw.go(300, 300);
        StdDraw.setColor(magenta);
        StdDraw.spot(400);
        StdDraw.setColor(sienna);
        StdDraw.spot(300, 300);
        StdDraw.setColor(magenta);
        StdDraw.spot(200);
        StdDraw.show();
    }
}
```

## Monochrome Luminance

**Monochrome luminance (Y).** Effective brightness of a color.

**Application:** Which font colors will be most readable with what background colors on TV and computer screens?

NTSC formula: grayscale = 0.2989r + 0.5870g + 0.1140b.

```
public static Color toGray(Color c) {
    int r = c.getRed();
    int g = c.getGreen();
    int b = c.getBlue();
    int luminance = (int) (0.2989*r + 0.5870*g + 0.1140*b);
    Color gray = new Color(luminance, luminance, luminance);
    return gray;
}
```

**More uses.** Pass colors to functions; return colors from functions.

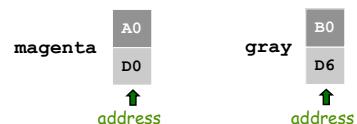

7

8

## OOP Context for Color

Possible memory representation.

D0	D1	D2	D3	D4	D5	D6	D7	D8
255	0	255	0	0	0	105	105	105

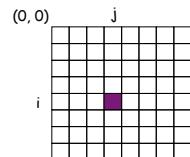

Bottom line: we are writing programs that manipulate color.

## Raster Graphics

Raster graphics: basis for image processing.

Set of values: 2D array of Color objects (pixels).

Operations: for Picture variable pic.

Operation	Description	Return type
pic.getHeight()	return height of image	int
pic.getWidth()	return width of image	int
pic.getColor(i, j)	return color of pixel (i, j)	Color
pic.setColor(i, j, c)	set color of pixel (i, j) to c	void
pic.show()	display the picture in a window	void
pic.save(s)	save the picture to file s	void

Reference: <http://www.cs.princeton.edu/IntroCS/31datatype>

9

10

## Image Processing: Monochrome Luminance

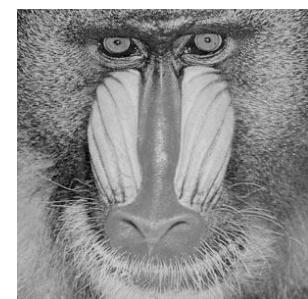

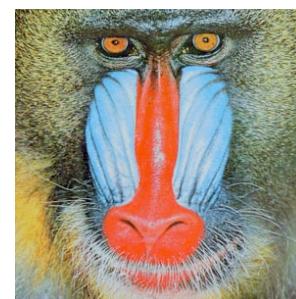

Goal. Convert color image to grayscale according to NTSC formula.

```
import java.awt.Color;

public class Grayscale {
    public static void main(String args[]) {
        Picture pic1 = new Picture(args[0]);
        int width = pic1.width();
        int height = pic1.height();
        Picture pic2 = new Picture(width, height);
        for (int i = 0; i < width; i++) {
            for (int j = 0; j < height; j++) {
                Color c = pic1.getColor(i, j);
                Color gray = toGray(c);
                pic2.setColor(i, j, gray);
            }
        }
        pic1.show();
        pic2.show();
    }
}
```

## Image Processing: Monochrome Luminance

Grayscale.java. Creates two Picture objects and windows.

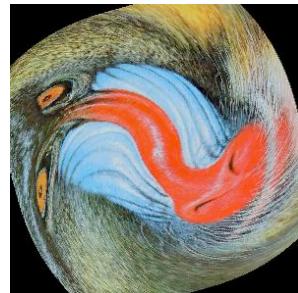

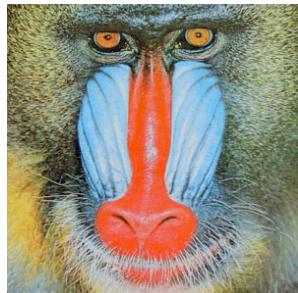

11

12

## Image Processing: Swirl Filter

`Swirl.java`. Creates two `Picture` objects and windows.

## Image Processing: Swirl Filter

Goal. Create swirl special effect by setting color of output pixel  $(i, j)$  to color of some other input pixel  $(ii, jj)$ .

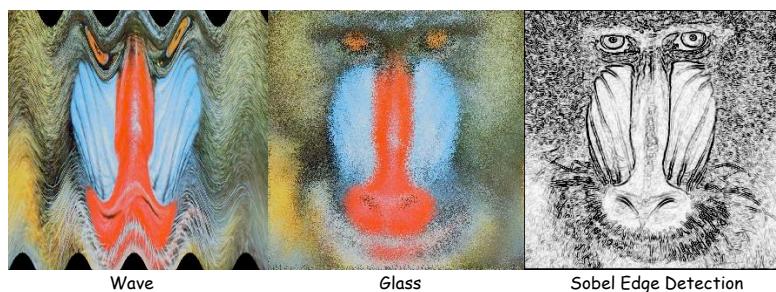

```
double i0 = 0.5 * width;
double j0 = 0.5 * height;

for (int i = 0; i < width; i++) {
    for (int j = 0; j < height; j++) {
        double di = i - i0;
        double dj = j - j0;
        double r = Math.sqrt(di*di + dj*dj);
        double a = Math.PI / 256 * r;
        int ii = (int) (-di*Math.cos(a) + dj*Math.sin(a) + i0);
        int jj = (int) ( di*Math.sin(a) + dj*Math.cos(a) + j0);
        if (ii >= 0 && ii < width && jj >= 0 && jj < height)
            pic2.setPixel(i, j, pic1.getPixel(ii, jj));
    }
}
```

13

14

## Special Effects: Baboon

15

## OOP Context for Picture

Immutability. Can't change a `Color` object's value once created.

Mutability. Can **change** a `Picture` object's value.

```
Color c = pic.getColor(0, 0);
pic.setColor(3, 0, c);
```

D0	Red	Yellow	Blue	Red
D4	Grey	Grey	Green	Green
D8	Blue	Orange	Green	Light Green
DC	Pink	Purple	Purple	Purple

Object reference is analogous to variable name.

- We can manipulate the value that it holds.
- We can pass it to a function / method.

16

## Strings

- String data type:** basis for text processing.  
**Set of values:** sequence of Unicode characters.  
**Operations (partial):** for String variable `s`.

Operation	Description	s	Return
<code>s.length()</code>	return length of <code>s</code>	Hello	5
<code>s.charAt(1)</code>	return char of <code>s</code> at index 1	Hello	e
<code>s.substring(1, 4)</code>	return substring of <code>s</code> from 1 (inclusive) to 4 (exclusive)	Hello	ell
<code>s.toUpperCase()</code>	return uppercase version of <code>s</code>	Hello	HELLO
<code>s.endsWith(".com")</code>	does <code>s</code> end with <code>.com</code> ?	cnn.com	true
<code>s.compareTo("Goodbye")</code>	return a positive integer, negative integer or zero based on string comparison	Hello	-1

Reference: <http://java.sun.com/j2se/1.4.2/docs/api/java/lang/String.html>

17

## Sorting Strings

Last lecture: quicksort array of real numbers.

To sort strings:

- Replace all occurrences of `double` with `String`.

```
static void exch(String[] a, int i, int j) {
    String swap = a[i];
    a[i] = a[j];
    a[j] = swap;
}
```

- Rewrite `less` to compare elements lexicographically.

```
static boolean less(String s, String t) {
    return (s.compareTo(t) < 0);
}
```

18

## Redundancy Detector

**Longest repeated substring.** Given a string, find the longest substring that appears at least twice.

a a c a a g t t t a c a a g c

Brute force.

- Try all indices `i` and `j` for start of possible match.
- Compute longest common prefix for each pair (quadratic).

a a c a a g t t t a c a a g c  
 i →      j →

Applications.

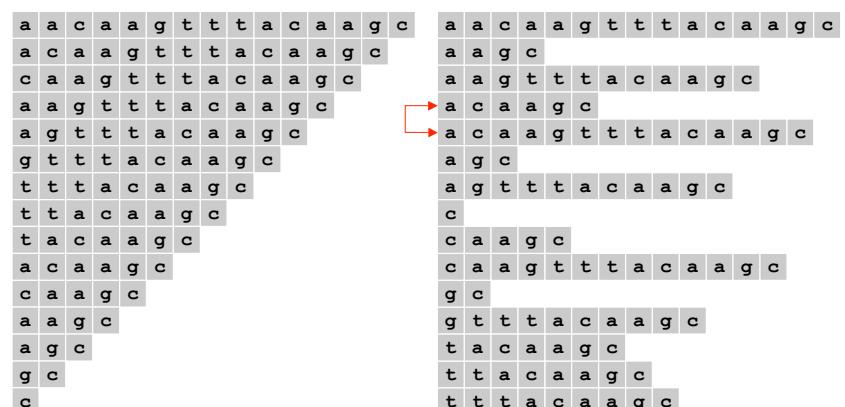

- Computational molecular biology.
- Burrows-Wheeler transform for data compression.
- Plagiarism detection.

19

## Longest Repeated Substring: A Sorting Solution

A sorting solution.

- Form suffixes, and sort them to bring repeated substrings together.
- Compute longest prefix between N-1 adjacent suffixes.

20

## Longest Repeated Substring: Java Implementation

Suffix sorting implementation.

```
int N = s.length();
String[] suffixes = new String[N];
for (int i = 0; i < N; i++)
    suffixes[i] = s.substring(i, N);
Arrays.sort(suffixes);
```

Longest repeated substring. Search only adjacent suffixes.

```
String lrs = "";
for (int i = 0; i < N-1; i++) {
    String x = lcp(suffixes[i], suffixes[i+1]);
    if (x.length() > lrs.length()) lrs = x;
}
```

LCP. Find the longest string that is a prefix of both  $s$  and  $t$ .

Ex:  $\text{lcp}(\text{"acaagttac"}, \text{"acaagc"}) = \text{"acaag"}$ .

## Longest Repeated Substring: Analysis

Computational experiments.

Input File	Characters	Brute	Suffix Sort	Length
LRS.java	2,162	0.6 sec	0.14 sec	73
Amendments	18,369	37 sec	0.25 sec	216
Aesop's Fables	191,945	3958 sec	1.0 sec	58
Moby Dick	1.2 million	43 hours <sup>†</sup>	7.6 sec	79
Bible	4.0 million	20 days <sup>†</sup>	34 sec	11
Chromosome 11	7.1 million	2 months <sup>†</sup>	61 sec	12,567
Pi	10 million	4 months <sup>†</sup>	84 sec	14

<sup>†</sup> estimated

Lesson. Sorting to the rescue; enables new research.

21

22

## Non-Standard Input

Standard input: from keyboard, or use OS to redirect from one file.

Goal: read from several different input streams.

In data type. Read text from `stdin`, a file, a web site, or network.

Ex: Are two text files identical?

```
public class Diff {
    public static void main(String[] args) {
        In in0 = new In(args[0]);
        In in1 = new In(args[1]);
        String s = in0.readAll();
        String t = in1.readAll();
        System.out.println(s.equals(t));
    }
}
```

## Screen Scraping

Find current stock price of Google.

- `s.indexOf(t, i)`: index of 1<sup>st</sup> occurrence of pattern  $t$  in string  $s$ , starting at offset  $i$ . 
- Read raw html from <http://finance.yahoo.com/q?s=goog>
- Find 1<sup>st</sup> string delimited by `<b>` and `</b>` appearing after Last Trade

```
public class StockQuote {
    public static void main(String[] args) {
        String name = "http://finance.yahoo.com/q?s=" + args[0];
        In in = new In(name);
        String input = in.readAll();
        int start = input.indexOf("Last Trade:", 0);
        int from = input.indexOf("<b>", start);
        int to = input.indexOf("</b>", from);
        String price = input.substring(from + 3, to);
        System.out.println(price);
    }
}
```

```
% java StockQuote goog
131.00
```

23

24

## Day Trader

Add bells and whistles.

- Plot price in real-time.
- Notify user if price dips below a certain price.
- Embed logic to determine when to buy and sell.
- Automatically send buy and sell orders to trading firm.

**Warning.** Use at your own financial risk.

## OOP Context for Strings

Possible memory representation of a string.

- `s = "aacaagtttacaage";`

D0	D1	D2	D3	D4	D5	D6	D7	D8	D9	DA	DB	DC	DD	DE
a	a	c	a	a	g	t	t	t	a	c	a	a	g	c

- `t = s.substring(5, 15);`      t      B0      B1  
            D5      10

- No characters are **copied** when you invoke `substring` method!

Consequences.

- Calling `substring` takes constant time (instead of linear).
- Creating suffixes takes linear space (instead of quadratic).

25

26

## OOP Summary

**Object.** Holds a data type value; variable name refers to object.

In Java, programs manipulate references to objects.

- Exception: primitive types, e.g., `boolean`, `int`, `double`.
- Reference types: `String`, `Picture`, `Color`, arrays, everything else.
- OOP purist: language should not have separate primitive types.

**Bottom line.** We wrote programs that manipulate colors, pictures, strings, and input streams.

**Next time.** We'll learn how to **create** new data types so that we can write programs to manipulate **our** own abstractions.

27
