

# Representing and Matching Binding Sites with Grids

Thomas Funkhouser  
Princeton University  
CS597A, Fall 2005

## Goal

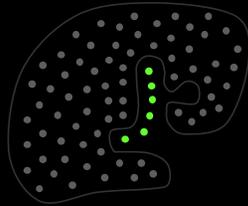

Match binding site to others in a database of proteins with known biochemical function

## Binding Site Representations

Possible binding site descriptions

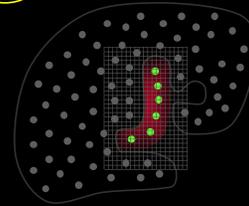

- Points (atoms, residues, pseudo-centers, critical points, ...)
- Surfaces (spheres/tori, meshes, radial extent, ...)
- Volumes (alpha shapes, grids, ...)

## Binding Site Representations

Possible binding site descriptions

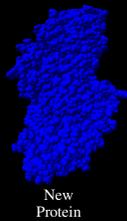

- Points (atoms, residues, pseudo-centers, critical points, ...)
- Surfaces (spheres/tori, meshes, radial extent, ...)
- Volumes (alpha shapes, grids, ...)

## Grid Representations

Binding site ...

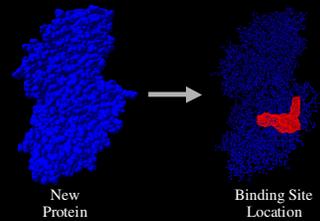

- Detection
- Modeling
- Alignment
- Matching
- Classification
- Analysis

## Grid Representations

Binding site ...

- Detection
- Modeling
- Alignment
- Matching
- Classification
- Analysis

### Grid Representations

## Simulation-Based Modeling

Compute propensity for different "probes" to appear at grid points

$$P_p^0 = \sum_{i=1}^N \left( \frac{A_{X_i,C}}{r_{pi}^{12}} - \frac{B_{X_i,C}}{r_{pi}^6} \right)$$

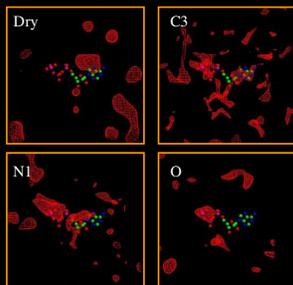

Lennert-Jones  
Potential

[Ard5]

## Simulation-Based Modeling

Compute propensity for different "probes" to appear at grid points

Predicted  
Binding Site  
Model for  
Ikp8-1-H-ATP-1\_  
using GRID

[Goodford85]

## Simulation-Based Modeling

Grids of this type are sometimes used to accelerate computation of scoring functions in docking programs

$$\Delta G_{bind} = C_{lipophilic} \sum f(r_{lc}) +$$

$$C_{hbond-neut-neut} \sum g(\Delta r)h(\Delta \alpha) +$$

$$C_{hbond-neut-charged} \sum g(\Delta r)h(\Delta \alpha) +$$

$$C_{hbond-charged-charged} \sum g(\Delta r)h(\Delta \alpha) +$$

$$C_{max-metal-ion} \sum f(r_{mi})h(\Delta \alpha) +$$

$$C_{rot}H_{rot} +$$

$$C_{polar-phob}V_{polar-phob}$$

$$C_{coul}E_{coul} +$$

$$C_{vdw}E_{vdw} +$$

solvationterms

Discussion

## Knowledge-Based Modeling

Simulation from physical principles is difficult

$$\Delta G_{bind} = C_{lipophilic} \sum f(r_{lc}) +$$

$$C_{hbond-neut-neut} \sum g(\Delta r)h(\Delta \alpha) +$$

$$C_{hbond-neut-charged} \sum g(\Delta r)h(\Delta \alpha) +$$

$$C_{hbond-charged-charged} \sum g(\Delta r)h(\Delta \alpha) +$$

$$C_{max-metal-ion} \sum f(r_{mi})h(\Delta \alpha) +$$

$$C_{rot}H_{rot} +$$

$$C_{polar-phob}V_{polar-phob}$$

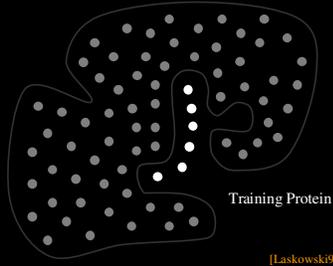

$$C_{coul}E_{coul} +$$

$$C_{vdw}E_{vdw} +$$

Results

Discussion

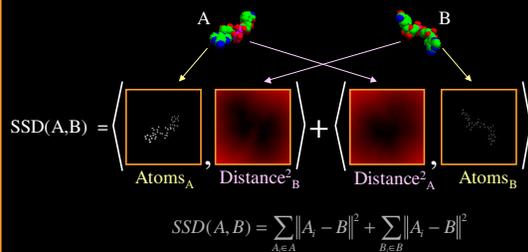

## Matching with Grid Correlation

The correlation (dot product) between two grids provides a good measure of similarity

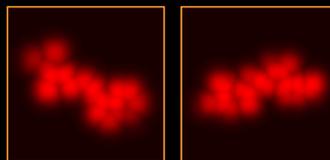

## Matching with Grid Correlation

The correlation (dot product) between two grids provides a good measure of similarity

## Fast Rotational Matching

Goal: given two sets of grids (representing molecules), find the maximal correlation over all rotations

[Kovacs et al., 2002]

## Fast Rotational Matching (2D)

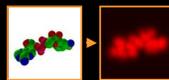

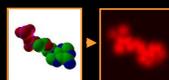

Given two molecules ...

Molecule

## Fast Rotational Matching (2D)

1. Compute grids representing molecules

Molecule 2D Grid

### Fast Rotational Matching (2D)

2. Decompose grids into concentric circles

Molecule      2D Grid

### Fast Rotational Matching (2D)

3. Represent grids as 1D functions of angle for all circles

Molecule      2D Grid      Circular Functions

### Fast Rotational Matching (2D)

4. Convolve to compute correlation for all rotations

Molecule      2D Grid      Circular Functions

Correlation  
Rotation  
Rotational Correlation

### Fast Rotational Matching (2D)

4. Convolve to compute correlation for all rotations

Molecule      2D Grid      Circular Functions      Frequency Decompositions

Fourier Transform      Inverse Fourier Transform

Correlation in Frequency Domain      Correlation      Rotation      Rotational Correlation

### Fast Rotational Matching (2D)

5. Check correlation at every rotation to find maximum

Molecule      2D Grid      Circular Functions      Frequency Decompositions

Fourier Transform      Inverse Fourier Transform

Correlation in Frequency Domain      Correlation      Rotation      Rotational Correlation

Maximum Correlation

### Fast Rotational Matching (3D)

Similar to 2D, but spheres instead of circles

Molecule      3D Grid      Spherical Functions      Harmonic Decompositions

Spherical Harmonic Transform      Inverse Wigner-D Transform

Correlation in Frequency Domain      Correlation      Rotation      Rotational Correlation

Maximum Correlation

[Kovacs et al., 2002]

### Fast Rotational Matching (3D)

Key step is inverse Wigner-D transform

Spherical Harmonic Transform

Inverse Wigner-D Transform

Maximum Correlation

Correlation in Frequency Domain

Rotation Rotational Correlation

Molecule 3D Grid Spherical Functions Harmonic Decompositions

[Kovacs et al., 2002]

### Fast Rotational Matching (3D)

Theoretical complexity:

- Complexity is  $O(N^4)$  for  $N \times N \times N$  grid, rather than  $O(N^6)$
- Complexity of Wigner-D<sup>-1</sup> independent of #fields/molecule
- Complexity independent of #atoms

Practical complexity (times in seconds):

Grid Resolution (voxels)	Max Error (degrees)	Per Field			Per Pair		
		Spherical Grid	Spherical Harmonics	Per Field Total	Cross-Multiply	Wigner-D <sup>-1</sup> Transform	Per Pair Total
32x32x32	5.5	0.02	0.01	0.03	0.01	0.02	0.03
64x64x64	2.8	0.18	0.10	0.28	0.19	0.28	0.47
128x128x128	1.4	2.47	1.17	3.64	5.55	4.45	10.00

### Fast Rotational Matching (3D)

Theoretical complexity:

- Complexity is  $O(N^4)$  for  $N \times N \times N$  grid, rather than  $O(N^6)$
- Complexity of Wigner-D<sup>-1</sup> independent of #fields/molecule
- Complexity independent of #atoms

Practical complexity (times in seconds):

Grid Resolution (voxels)	Max Error (degrees)	Per Field			Per Pair		
		Spherical Grid	Spherical Harmonics	Per Field Total	Cross-Multiply	Wigner-D <sup>-1</sup> Transform	Per Pair Total
32x32x32	5.5	0.02	0.01	0.03	0.01	0.02	0.03
64x64x64	2.8	0.18	0.10	0.28	0.19	0.28	0.47
128x128x128	1.4	2.47	1.17	3.64	5.55	4.45	10.00

### Fast Rotational Matching (3D)

Theoretical complexity:

- Complexity is  $O(N^4)$  for  $N \times N \times N$  grid, rather than  $O(N^6)$
- Complexity of Wigner-D<sup>-1</sup> independent of #fields/molecule
- Complexity independent of #atoms

Practical complexity (times in seconds):

Grid Resolution (voxels)	Max Error (degrees)	Per Field			Per Pair

Results

Discussion

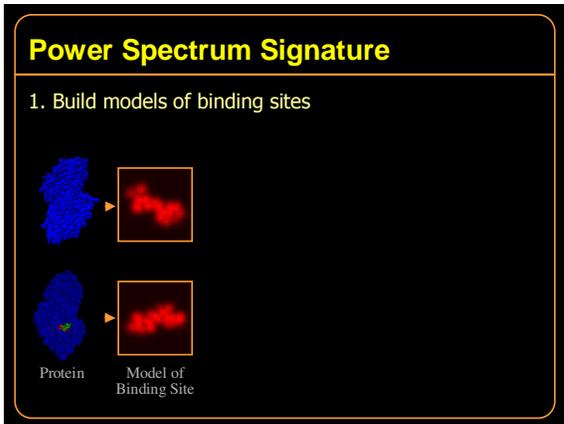

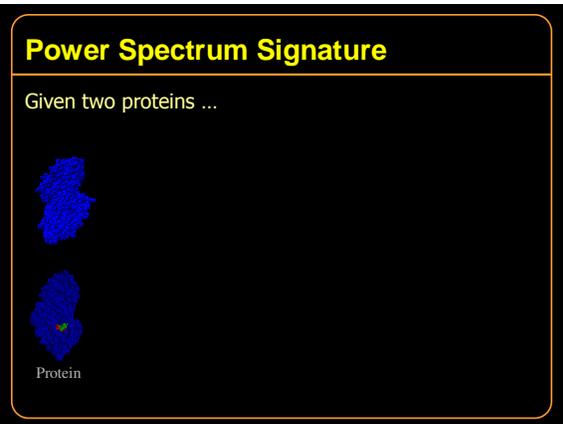

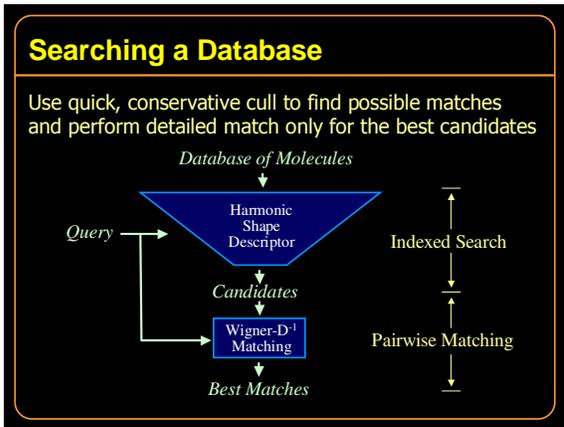

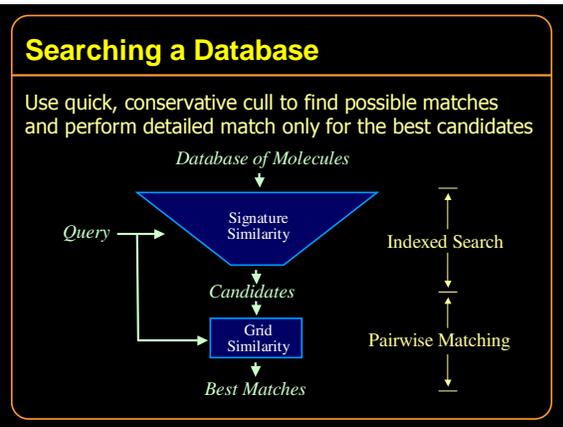

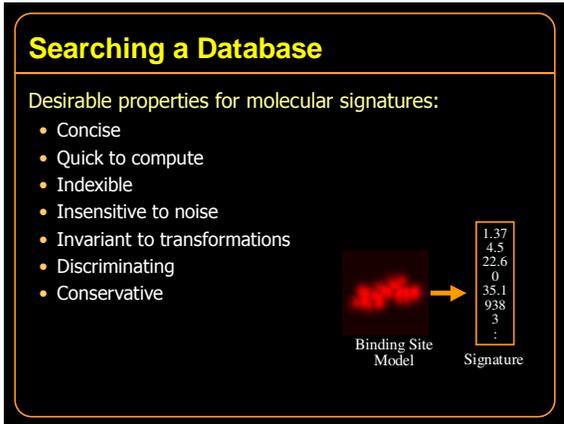

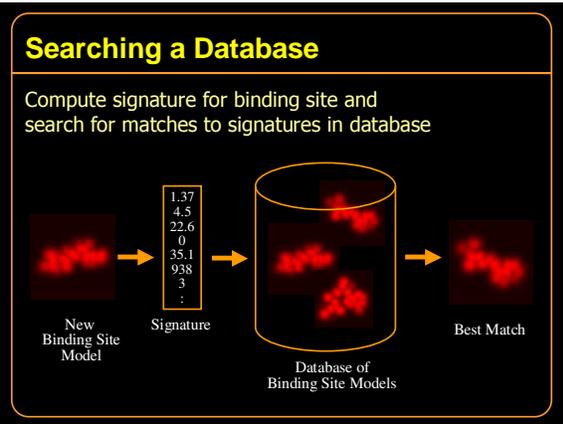

### Searching a Database

One-by-one matching is slow for large database

New Binding Site Model

Database of Binding Site Models

Best Match

### Power Spectrum Signature

2. Build spherical functions for concentric shells at different radii

Protein    Model of Binding Site    Spherical Functions

### Power Spectrum Signature

3. Decompose the spherical function at each radius into spherical harmonics

Protein    Model of Binding Site    Spherical Functions    Spherical Harmonics (for each radius)

### Power Spectrum Signature

4. Store amplitude of spherical harmonic coefficients for every frequency and radius in harmonic descriptor

Protein    Model of Binding Site    Spherical Functions    Spherical Harmonics (for each radius)    Harmonic Descriptor

### Power Spectrum Signature

5. Define distance (dissimilarity) between binding sites as L<sup>2</sup> distance between harmonic descriptors

Protein    Model of Binding Site    Spherical Functions    Spherical Harmonics (for each radius)    Harmonic Descriptor    Distance Measure

### Power Spectrum Signature

Main properties:

- Fast, concise, robust, indexable, etc.
- Invariant to grid orientations
- Works for multiple grids per binding site
- Conservative approximation

Discussion

## Test Data Set

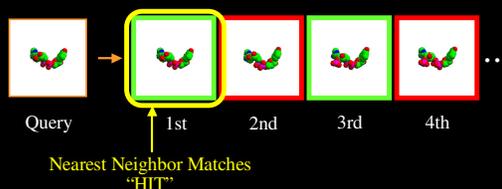

176 binding sites / 14 ligand types (classes)

## Classification Experiment

"Leave-one-out" classification experiment

- Match every ligand against all the others in data set
- Log a "hit" when best match performs same reaction
- Report percentage of hits (correctly classified ligands)

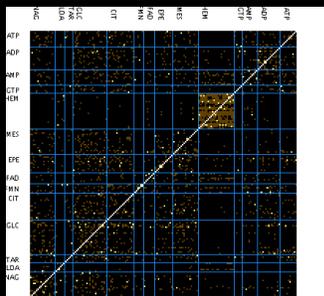

## Classification Results

Classification rate:

SiteAtoms	= 35%
SCOP	= 17%
CATH	= 13%
CE	= 11%
FASTA	= 10%
Random	= 5%

Best Matches:  
(White = Self match)  
(Yellow = Nearest Neighbor)  
(Orange = 1<sup>st</sup> tier match)

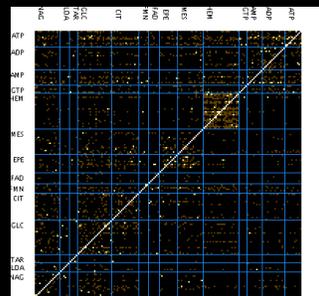

## Classification Results

Classification rate:

SiteAtoms	= 35%
SiteGrid	= 32%
SCOP	= 17%
CATH	= 13%
CE	= 11%
FASTA	= 10%
Random	= 5%

Best Matches:  
(White = Self match)  
(Yellow = Nearest Neighbor)  
(Orange = 1<sup>st</sup> tier match)

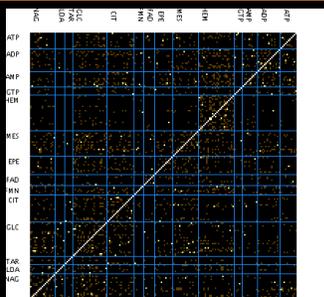

## Classification Results

Classification rate:

SiteGrid	= 32%
SiteSig	= 20%

Best Matches:  
(White = Self match)  
(Yellow = Nearest Neighbor)  
(Orange = 1<sup>st</sup> tier match)

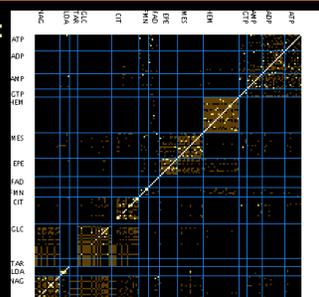

## Classification Results

Classification rate:

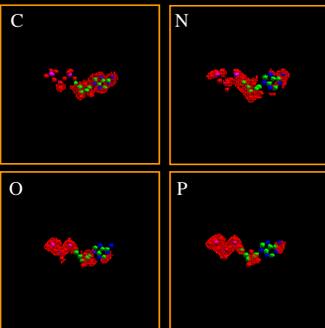

ClippedGrid	= 65%
ClippedSig	= 71%
SiteGrid	= 32%
SiteSig	= 20%

Best Matches:  
(White = Self match)  
(Yellow = Nearest Neighbor)  
(Orange = 1<sup>st</sup> tier match)
