

13. Sorting and Searching

A typical client: Whitelist filter

A **blacklist** is a list of entities to be *rejected* for service. ← Examples: Overdrawn account Spammers

A **whitelist** is a list of entities to be *accepted* for service. ← Examples: Account in good standing Friends and relatives

Whitelist filter

- Read a list of strings from a *whitelist* file.
- Read strings from StdIn and write to StdOut only those in the whitelist.

Example. Email spam filter
(message contents omitted)

whitelist
alice@home
bob@office
carl@beach
dave@boat

StdIn

bob@office
carl@beach
marvin@spam
bob@office
bob@office
mallory@spam
dave@boat
eve@airport
alice@home
...

5

Strawman implementation: Sequential search (first try)

Sequential search

- Check each array entry 0, 1, 2, 3, ... for match with search string.
- If match found, return index of matching string.
- If not, return -1.

```
public static int search(String key, String[] a)
{
    for (int i = 0; i < a.length; i++)
        if (a[i] == key) return i;
    return -1;
}
```

Compares references, not strings!

7

Mathematical analysis of whitelist filter using sequential search

Model

- N strings on the whitelist.
- cN transactions for c not large.
- String length not long.

whitelist	transactions
xwnzb	1nuqv
dqwak	1nuqv
lnuqv	czpxw
czpxw	czpxw
bshla	dqwak
idhld	idhld
utfyw	utfyw
dobqi	dobqi
hafah	hafah
tsirv	tsirv

Analysis

- A random search hit checks about half of the N strings on the whitelist, on average.
- A random search miss checks all of the N strings on the whitelist, on average.
- Expected order of growth of running time: N^2 .

8

Random representative inputs for searching and sorting

Generate N random strings of length L from a given alphabet

```
public class Generator
{
    public static String randomString(int L, String alpha)
    {
        char[] a = new char[L];
        for (int i = 0; i < L; i++)
        {
            int t = StdRandom.uniform(alpha.length());
            a[i] = alpha.charAt(t);
        }
        return new String(a);
    }

    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        int L = Integer.parseInt(args[1]);
        String alpha = args[2];
        for (int i = 0; i < N; i++)
            StdOut.println(randomString(L, alpha));
    }
}

of duplicates

not much chance
of duplicates

9

Empirical tests of sequential search

Whitelist filter scenario

- Whitelist of size N .
- $10N$ transactions.

N	T_N (seconds)	$T_N/T_{N/2}$	transactions per second
10,000	3		3,333
20,000	9		2,222
40,000	35	3.9	1,143
80,000	149	4.3	536
...			
1.28 million		4	34

```
% java Generator 10000 ...
3 seconds
% java Generator 20000 ...
9 seconds
% java Generator 40000 ...
35 seconds
% java Generator 80000 ...
149 seconds
```

... = 10 a-z | java TestSS
a-z = abcdefghijklmnopqrstuvwxyz

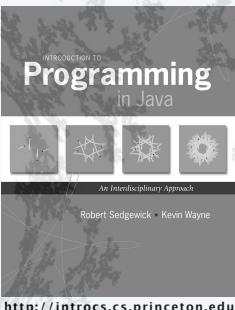

12.8 million transactions
at a rate of 34 per second
and dropping

Hmm. That doesn't seem too good.

Hypothesis. Order of growth is N^2 . ← Does NOT scale.

10

13. Sorting and Searching

- A typical client
- **Binary search**
- Insertion sort
- Mergesort
- Longest repeated substring

<http://introcs.cs.princeton.edu>

Binary search

Binary search

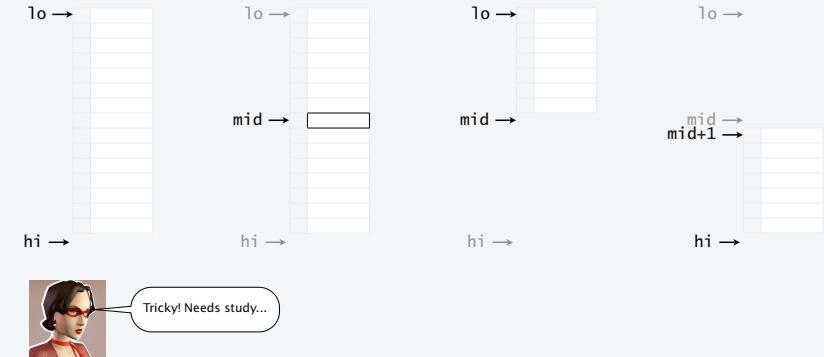

- Keep the array in **sorted order** (stay tuned).
- Examine the middle key.
- If it matches, return its index.
- If it is larger, search the half with lower indices.
- If it is smaller, search the half with upper indices.

Binary search arithmetic

Notation. $a[lo, hi]$ means $a[lo], a[lo+1] \dots a[hi-1]$ (does not include $a[hi]$).

Search in $a[lo, hi]$ $mid = lo + (hi-lo)/2$ Lower half: $a[lo, mid]$ Upper half: $a[mid+1, hi]$

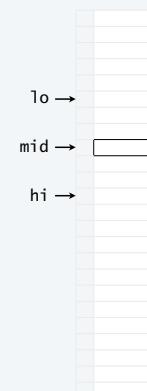

14

Binary search: Java implementation

```
public static int search(String key, String[] a)
{   return search(key, a, 0, a.length); }

public static int search(String key, String[] a, int lo, int hi)
{
    if (hi <= lo) return -1;
    int mid = lo + (hi - lo) / 2;
    int cmp = a[mid].compareTo(key);
    if      (cmp > 0) return search(key, a, lo, mid);
    else if (cmp < 0) return search(key, a, mid+1, hi);
    else            return mid;
}
```

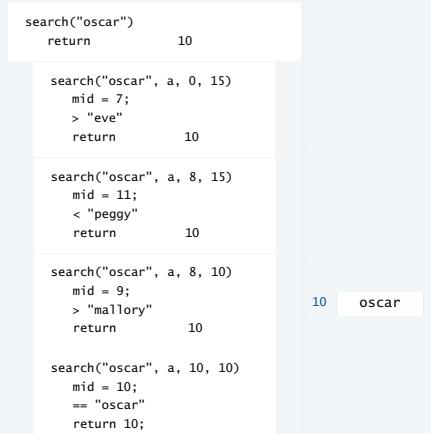

15

Recursion trace for binary search

```
public static int search(String key, String[] a)
{   return search(key, a, 0, a.length); }

public static int search(String key, String[] a,
                        int lo, int hi)
{
    if (hi <= lo) return -1;
    int mid = lo + (hi - lo) / 2;
    int cmp = a[mid].compareTo(key);
    if      (cmp > 0) return search(key, a, lo, mid);
    else if (cmp < 0) return search(key, a, mid+1, hi);
    else            return mid;
}
```

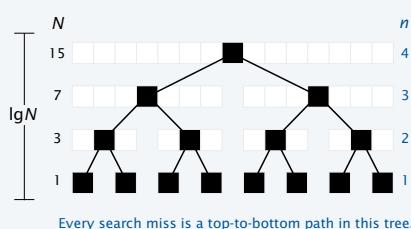

16

Mathematical analysis of binary search

Exact analysis for search miss for $N = 2^n - 1$

- Note that $n = \lg(N+1) \sim \lg N$.
- Subarray size for 1st call is $2^n - 1$.
- Subarray size for 2nd call is $2^{n-1} - 1$.
- Subarray size for 3rd call is $2^{n-2} - 1$.
- ...
- Subarray size for n th call is 1.
- Total # compares (one per call): $n \sim \lg N$.

Proposition. Binary search uses $\sim \lg N$ compares for a search miss.

Proof. An (easy) exercise in discrete math.

Interested in details? Take a course in algorithms.

17

Proposition. Binary search uses $\sim \lg N$ compares for a random search hit.

Proof. A slightly more difficult exercise in discrete math.

Empirical tests of binary search

Whitelist filter scenario

- Whitelist of size N .
- $10N$ transactions.

N	T_N (seconds)	$T_N/T_{N/2}$	transactions per second (thousands)
100,000	1		
200,000	3		
400,000	6	2	67
800,000	14	2.35	57
1,600,000	33	2.33	48
10.28 million	264	2	48

```
% java Generator 100000 ...  
1 seconds  
% java Generator 200000 ...  
3 seconds  
% java Generator 400000 ...  
6 seconds  
% java Generator 800000 ...  
14 seconds  
% java Generator 1600000 ...  
33 seconds
```

... = 10 a-z | java TestBS
a-z = abcdefghijklmnopqrstuvwxyz

nearly 50,000 transactions per second, and holding

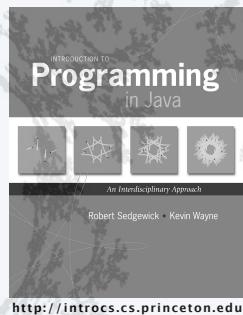

Great! But how do I get the list into sorted order at the beginning?

Will scale.

21

TEQ 0 on sorting

- Q. What's the most efficient way to sort 1 million 32-bit integers?

22

Insertion sort algorithm

Insertion sort

- Move down through the array.
- Each item *bubbles up* above the larger ones above it.
- Everything above the current item is in order.
- Everything below the current item is untouched.

Like bubble sort, but not bubble sort.

We don't teach bubble sort any more because this is simpler and faster.

a-z = abcdefghijklmnopqrstuvwxyz
```

...

1.28 million

14400

4

← 4 hours

Confirms hypothesis that order of growth is N^2 .

will NOT scale

And $4x64/24 = 10+$ days to sort 10 million? Sounds bad.

Do you have anything better?

26

A rule of thumb

Moore's law. The number of transistors in an integrated circuit doubles about every 2 years.

Implications

- Memory size doubles every two years.
- Processor speed doubles every two years.

Gordon Moore
Founder of Intel
1929 –

Sedgewick's rule of thumb.
It takes *seconds* to access
every word in a computer.

computer	instructions per second	words of memory
PDP-9	tens of thousands	tens of thousands
VAX 11-780	millions	millions
CRAY 1	tens of millions	tens of millions
MacBook Air	billions	billions

27

Scalability

An algorithm **scales** if its running time doubles when the problem size doubles.

2x faster computer with 2x memory using an alg that scales?

- Can solve problems we're solving now in half the time.
- Can solve a 2x-sized problem in the *same* time it took to solve an x-sized problem.
- Progress.

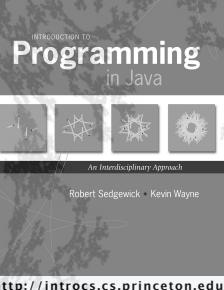

order of growth	scales?
N	✓
$N \log N$	✓
N^2	✗
N^3	✗

2x faster computer with 2x memory using quadratic alg?

- Can solve problems we're solving now in half the time.
- Takes *twice* as long to solve a 2x-sized problem as it took to solve an x-sized problem.
- Frustration.

Bottom line. Need **algorithms that scale** to keep pace with Moore's law.

- Mergesort
- Longest repeated substring

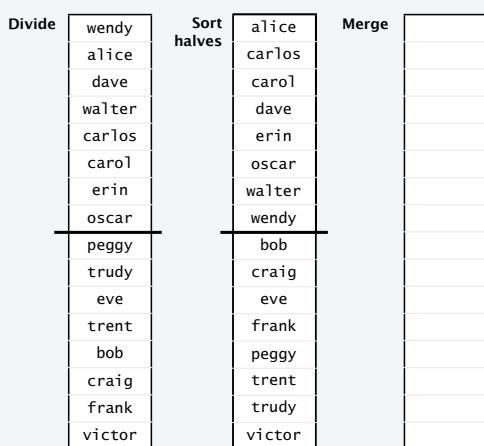

13. Sorting and Searching

- A typical client
- Binary search
- **Insertion sort**
- **Mergesort**
- Longest repeated substring

Mergesort algorithm

Merge sort

- Divide array into two halves.
- Recursively sort each half.
- Merge two halves to make sorted whole.

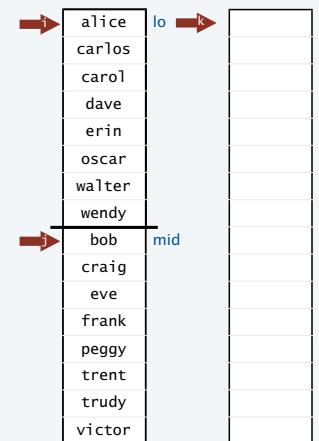

31

Merge: Java implementation

Abstract inplace merge

- Merge $a[lo, mid]$ with $a[mid, hi]$.
- Use auxiliary array for result.
- Copy back when sort complete.

```
private static String[] aux;
public static void merge(String[] a, int lo, int mid, int hi)
{
    // Merge a[lo, mid] with a[mid, hi] into aux[0, hi-lo].
    int i = lo, j = mid, N = hi - lo;
    for (int k = 0; k < N; k++)
    {
        if (i == mid) aux[k] = a[j++];
        else if (j == hi) aux[k] = a[i++];
        else if (a[j].compareTo(a[i]) < 0) aux[k] = a[j++];
        else aux[k] = a[i++];
    }
    // Copy back into a[lo, hi]
    for (int k = 0; k < N; k++)
        a[lo + k] = aux[k];
}
```

32

Merge sort: Java implementation

Merge sort

- Divide array into two halves.
- Recursively sort each half.
- Merge two halves to make sorted whole.

```
public class Merge {
    private static String[] aux;
    public static void merge(String[] a, int lo, int mid, int hi)
    { // See previous slide. }
    public static void sort(String[] a)
    { sort(a, 0, a.length); }
    public static void sort(String[] a, int lo, int hi)
    { // Sort a[lo..hi].
        int N = hi - lo;
        if (N <= 1) return;
        int mid = lo + N/2;
        sort(a, lo, mid);
        sort(a, mid, hi);
        merge(a, lo, mid, hi);
    }
}
```

13. Sorting and Searching

- A typical client
- Binary search
- Insertion sort
- **Mergesort**
- **Longest repeated substring**

Detecting repeats in a string

Longest repeated substring

- Given: A string s .
- Task: Find the longest substring in s that appears at least twice.

Example 1. a a c a a g t t t a c a a g c

Example 2. a a c a a g t t t a c a a g t t a c a a g c t a g c

Example 3 (first 100 digits of π).
 3 . 1 4 1 5 9 2 6 5 3 5 8 9 7 9 3 2 3 8 4
 6 2 6 4 3 3 8 3 2 7 9 5 0 2 8 8 4 1 9 7
 1 6 9 3 9 9 3 7 5 1 0 5 8 2 0 9 7 4 9 4
 4 5 9 2 3 0 7 8 1 6 4 0 6 2 8 6 2 0 8 9
 9 8 6 2 8 0 3 4 8 2 5 3 4 2 1 1 7 0 6 9

39

LRS example: repetitive structure in music

Mary had a little lamb

Für Elise

source: <http://www.bewitched.com/match/>

40

LRS applications

Analysts seek repeated sequences in real-world data because they are **causal**.

Example 1: Digits of π

- Q. Are they “random”?
- A. No, but we can’t tell the difference.
- Ex. Length of LRS in first 10 million digits is 14.

4587006606315588174881520920962829540
```

Example 2: Cryptography

- Find LRS.
- Check for “known” message header information.
- Break code.

```
11001001001110110111001011011100110
0010011111010011000001010100010001110011
00100011111011000000101010001000011111111
01010000100001000101001010100011000000
1011100010010010101101110010011001100111
0111001111010111100100100110110101110
100000101001000100010101010110000000
1011000001001110001011101101001101101100
```

Example 3: DNA

- Find LRS
- Look somewhere else for causal mechanisms
- Ex. Chromosome 11 has 7.1 million nucleotides

```
tgactaaatccagtttcaggccaaatttaggttacccac
gtgattatacgaaagggtttccpcgcgttaatcgggtgcgtcc
gaaacgtatggcccttttcgtctcgatgtgtttggccgg
ccttgtcatgcggcqacttaaacqatcaaataqgtqaa
aatcaaaaatccgggttcgttgacgcctagcgatgtcaag
atggggctatcatccgcacccaccttcggacccggatgt
ccgttagggccgtatgtctaaatgtctggaaatacccca
gtgtttgtggggcgacggatgtatgcataattttatgg
aggcgtatgtcttcggatgggttcgtatcttatttc
```

41

Warmup: Longest common prefix

Longest common prefix

- Given: Two strings string s and t.
- Task: Find the longest substring that appears at the beginning of both strings.

Example.

a a c a a g t t t a c a a g c

a a c a a g t t t a c a a g t t t a c a a g c t a g c

Implementation (easy)

```
private static String lcp(String s, String t)
{
    int N = Math.min(s.length(), t.length());
    for (int i = 0; i < N; i++)
        if (s.charAt(i) != t.charAt(i))
            return s.substring(0, i);
    return s.substring(0, N);
}
```

42

LRS: Brute-force implementation

```
public class LRS
{
    public static String lcp(String s)
    { // See previous slide. }

    public static String lrs(String s)
    {
        int N = s.length();
        String lrs = "";
        for (int i = 0; i < N; i++)
            for (int j = i+1; j < N; j++)
            {
                String x = lcp(s.substring(i, N), s.substring(j, N));
                if (x.length() > lrs.length()) lrs = x;
            }
        return lrs;
    }

    public static void main(String[] args)
    {
        String s = StdIn.readAll();
        StdOut.println(lrs(s));
    }
}
```

```
% more tiny.txt
aaacaagttaaagc

% java LRS
acaag
```

Analysis

- $\sim N^2/2$ calls on lcp().
- Obviously does not scale.

43

LRS: An efficient solution that uses sorting

0 1 2 3 4 5 6 7 8 9 10 11 12 13 14
a a c a a g t t t a c a a g c

1. Form suffix strings

0	a	a	c	a	a	g	t	t	t	a	c	a	a	g	c
1	a	c	a	a	g	t	t	t	a	c	a	a	g	c	
2	c	a	a	g	t	t	t	a	c	a	a	g	c		
3	a	a	g	t	t	t	a	c	a	a	g	c			
4	a	g	t	t	t	a	c	a	a	g	c				
5	g	t	t	a	c	a	a	g	c						
6	t	t	a	c	a	a	g	c							
7	t	t	a	c	a	a	g	c							
8	t	a	c	a	a	g	c								
9	a	c	a	a	g	c									
10	c	a	a	g	c										
11	a	a	g	c											
12	a	g	c												
13	g	c													
14	c														

2. Sort suffix strings

0	a	a	c	a	a	g	t	t	t	a	c	a	a	g	c
11	a	a	g	c											
3	a	a	g	t	t	t	a	c	a	a	g	c			
9	a	c	a	a	g	c									
1	a	c	a	a	g	t	t	t	a	c	a	a	g	c	
12	a	g	c												
4	a	g	t	t	t	a	c	a	a	g	c				
14	c														
10	c	a	a	g	c										
2	c	a	a	g	t	t	a	c	a	a	g	c			
13	g	c													
5	g	t	t	a	c	a	a	g	c						
8	t	a	c	a	a	g	c								
7	t	t	a	c	a	a	g	c							
6	t	t	a	c	a	a	g	c							

3. Find longest LCP among adjacent entries.

44

LRS implementation

```

public class LRS
{
    public static String lcp(String s)
    { // See previous slide.

        int N = s.length();
        String[] suffixes = new String[N];
        for (int i = 0; i < N; i++)
            suffixes[i] = s.substring(i, N);

        Form suffix
        strings

        Sort suffix
        strings

        Find longest
        LCP among
        adjacent
        entries.

        Merge.sort(suffixes);

        String lrs = "";
        for (int i = 0; i < N-1; i++)
        {
            String x = lcp(suffixes[i], suffixes[i+1]);
            if (x.length() > lrs.length()) lrs = x;
        }
        return lrs;
    }
}

```

- Important note**
- Efficiency depends on constant-time substring operation.
 - Forming suffix string array takes **quadratic time and space** if substring operation copies the substring to make a new string.
 - [see next slide]

```

% more example.txt
acaagtttacaaggc

% java LRS < tiny.txt
acaag

% more moby.txt
moby dick
herman melville
call me ishmael some years ago never
mind how long precisely having
little or no money
...
% java LRS < moby.txt
such a funny sporty gamy jesty joky
hoky poky lad is the ocean oh th

```

45

Two alternatives for implementing substrings

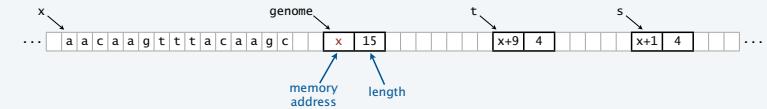

1. Refer to original string.

- No need to copy characters.
- Constant time.*

```

String genome = "aacaagttaacaaggc";
String s = genome.substring(1, 5);
String t = genome.substring(9, 13);

```

2. Copy the characters to make a new string.

- Allows potential to free up memory when the original string is no longer needed.
- Linear time (in the length of the substring).*

46

LRS: Empirical analysis

Model

- Alphabet: actg.
- N -character random strings.

```

% java Generator 1000000 1 actg | java LRS
2 seconds
% java Generator 10000000 1 actg | java LRS
21 seconds

```

Doubling

N	T_N	$T_N/T_{N/2}$
2,000,000	3	
4,000,000	7	2.3
8,000,000	16	2.3
16,000,000	39	2.4

x10

N	T_N	$T_N/T_{N/10}$
1,000,000	2	
10,000,000	21	10

Confirms hypothesis that the order of growth is $N \log N$ (for the sort).

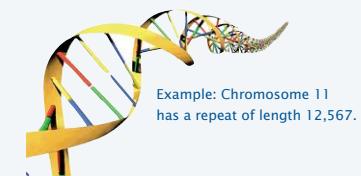

Bottom line. Scales with the size of the input and enables new research and development.

47

Important notes on LRS implementation

Long repeats

- More precise analysis reveals that running time is **quadratic** in the length of the longest repeat.
- Model has no long repeats.
- Real data may have long repeats.
- Linear** time algorithm (guarantee) is known.

String representation

- Efficiency depends on constant-time substring operation.
- 1995–2012: Java substring is constant-time.
- 2013: Java 7 changes to **linear-time** substring operation! (breaks this and many classic algorithms).
- Need to implement our own constant-time-substring.

Good thing I took
that algorithms
course!

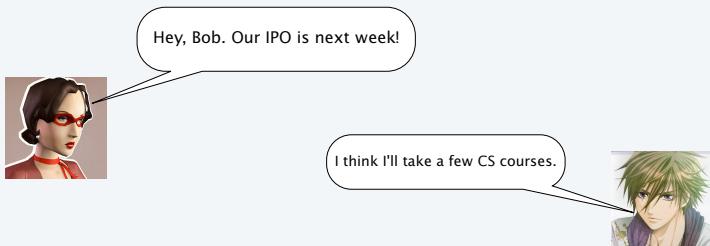

48

Summary

Binary search. Efficient algorithm to search a sorted array.

Merge sort. Efficient algorithm to sort an array.

Applications. Many, many, many things are enabled by fast sort and search.

49

13. Sorting and Searching

- A typical client
- Binary search
- Insertion sort
- Mergesort
- Longest repeated substring

13. Sorting and Searching
