

COS 226 course overview

What is COS 226?

- Intermediate-level survey course.
- · Programming and problem solving, with applications.
- · Algorithm: method for solving a problem.
- · Data structure: method to store information.

topic	data structures and algorithms		
data types	stack, queue, bag, union-find, priority queue		
sorting	quicksort, mergesort, heapsort, radix sorts		
searching	BST, red-black BST, hash table		
graphs	BFS, DFS, Prim, Kruskal, Dijkstra		
strings	KMP, regular expressions, tries, data compression		
advanced	B-tree, suffix array, maxflow, simplex		

Why study algorithms?

Their impact is broad and far-reaching.

Mysterious Algorithm Was 4% of Trading Activity Last Week

Why study algorithms?

Their impact is broad and far-reaching.

Internet. Web search, packet routing, distributed file sharing, ...

Biology. Human genome project, protein folding, ...

Computers. Circuit layout, file system, compilers, ...

Computer graphics. Movies, video games, virtual reality, ...

Security. Cell phones, e-commerce, voting machines, ...

Multimedia. MP3, JPG, HDTV, song recognition, face recognition, ...

Social networks. Recommendations, dating, advertisements, ...

Physics. N-body simulation, particle collision simulation, ...

Why study algorithms?

XXVII

To become a proficient programmer.

"The difference between a bad programmer and a good one is whether [the programmer] considers code or data structures more important. Bad programmers worry about the code. Good programmers worry about data structures and their relationships."

- Linus Torvalds (creator of Linux)

Why study algorithms?

For intellectual stimulation.

Frank Nelson Cole

"On the Factorization of Large Numbers"
American Mathematical Society, 1903

 2^{67} -1 = 193,707,721 × 761,838,257,287

Why study algorithms?

They may unlock the secrets of life and of the universe.

Scientists are replacing mathematical models with computational models.

"Algorithms: a common language for nature, human, and computer." — Avi Wigderson

Why study algorithms?

For fun and profit.

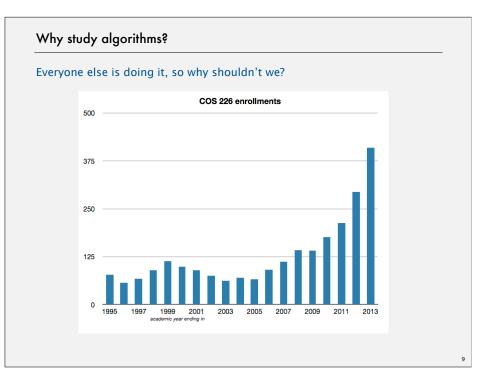

Who are you guys?

Who are we guys?

Josh Hug

Ananda Gunawardena

Bob Tarjan

Ruth Dannenfelser

Tengyu Ma

Deborah Varnell Katie Edwards

The usual suspects

Lectures. Introduce new material.

Precepts. Discussion, problem-solving, background for assignments.

What	When	Where	Who	Office Hours

† lead preceptor

Where to get help?

Piazza. Online discussion forum.

- · Low latency, low bandwidth.
- Mark solution-revealing questions as private.
- · Course announcements.

plazza http://www.piazza.com/class#fall2013/cos226

http://www.princeton.edu/~cos226

Office hours.

- · High bandwidth, high latency.
- See web for schedule.

Computing laboratory.

- Undergrad lab TAs in Friend 017.
- For help with debugging.
- See web for schedule.

http://www.princeton.edu/~cos226

13

Coursework and grading

Programming assignments. 45%

- Due on Wednesdays at 11:00 pm via electronic submission.
- 4 free late days. Lose 10% for each late day thereafter.
- · See web for full collaboration and lateness policy.

Exercises. 10%

· Due on Sundays at 11pm in Blackboard.

Exams. 15% + 30%

- · Midterm (in class on Tuesday, October 22).
- Final (to be scheduled by Registrar).

Staff discretion. To adjust borderline cases.

- Report errata.
- · Contribute to Piazza discussions.
- · Attend and participate in precept/lecture.
- · Answering in lecture-questions using a device.

Programs Midterm Exercises

A note on cheating

Cheating

- · Don't.
- · More than two dozen cases last semester in lower division CS courses.
- We possess and utilize highly advanced tools to detect plagiarism.
- · Most likely penalty is a one year-suspension.
 - Copying code.
 - Looking at other student's (past or present) code.
 - Giving your code to someone else (present or future).
 - Submitting to the Coursera autograder.
 - COS226 staff have no discretion!

22

What's ahead?

Lecture 1. [today] Union find.

Lecture 2. [Next Tuesday] Analysis of algorithms.

Precept 1. [Friday] Meets this week.

Exercise 1. Due via Bb submission at 11pm on Sunday, September 15th. Assignment 1. Due via electronic submission at 11:59pm on Wednesday, September 18th. Pro tip: Start early (after precept tomorrow).

Right course? See me.

Placed out of COS 126? Review Sections 1.1-1.2 of Algorithms, 4th edition (includes command-line interface and our I/O libraries).

Not registered? Go to any precept this week [only if not registered!].

Change precept? Use SCORE. Will set up system to swap next week

Algorithms 1.5 UNION-FIND Algorithms August find quick find quick union improvements applications http://algs4.cs.princeton.edu

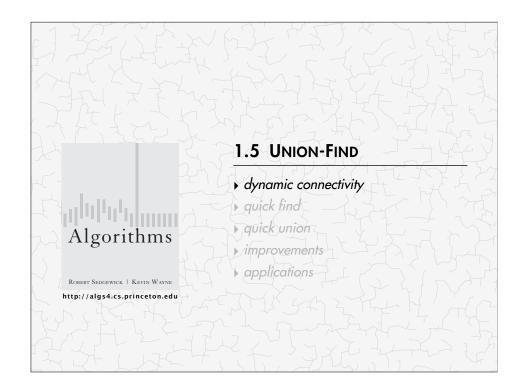

Subtext of today's lecture (and this course)

Steps to developing a usable algorithm.

- Model the problem.
- Find an algorithm to solve it.
- Fast enough? Fits in memory?
- If not, figure out why.
- Find a way to address the problem.
- · Iterate until satisfied.

The scientific method.

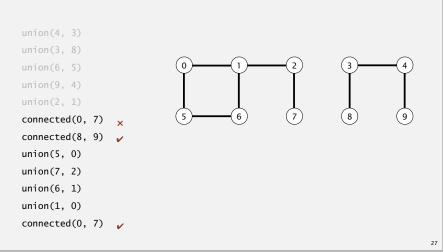

Mathematical analysis.

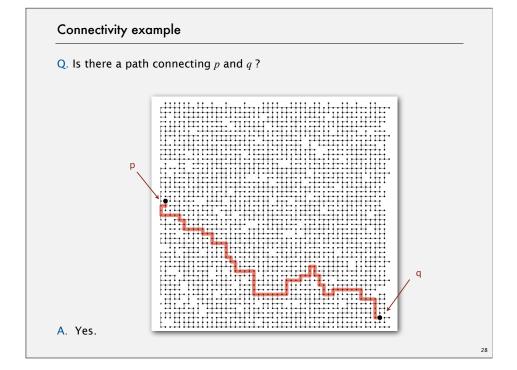

Dynamic connectivity

Given a set of N objects.

- · Union command: connect two objects.
- Find/connected query: is there a path connecting the two objects?

Modeling the objects

Applications involve manipulating objects of all types.

- Pixels in a digital photo.
- · Computers in a network.
- · Friends in a social network.
- · Transistors in a computer chip.
- · Elements in a mathematical set.
- · Variable names in Fortran program.
- · Metallic sites in a composite system.

When programming, convenient to name objects 0 to N -1.

- · Use integers as array index.
- · Suppress details not relevant to union-find.

can use symbol table to translate from site names to integers: stay tuned (Chapter 3)

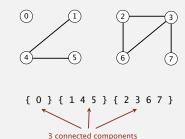

29

Modeling the connections

We assume "is connected to" is an equivalence relation:

- Reflexive: *p* is connected to *p*.
- Symmetric: if p is connected to q, then q is connected to p.
- Transitive: if p is connected to q and q is connected to r, then p is connected to r.

Connected components. Maximal set of objects that are mutually connected.

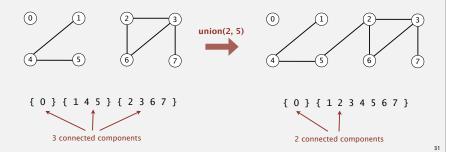

30

Implementing the operations

Find query. Check if two objects are in the same component.

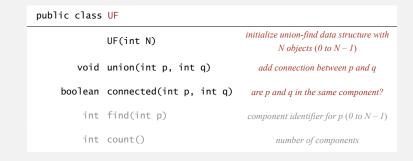

Union command. Replace components containing two objects with their union.

Union-find data type (API)

Goal. Design efficient data structure for union-find.

- Number of objects N can be huge.
- Number of operations *M* can be huge.
- · Find queries and union commands may be intermixed.

Dynamic-connectivity client

- Read in number of objects N from standard input.
- Repeat:
 - read in pair of integers from standard input
 - if they are not yet connected, connect them and print out pair

```
public static void main(String[] args)
{
  int N = StdIn.readInt();
  UF uf = new UF(N);
  while (!StdIn.isEmpty())
  {
    int p = StdIn.readInt();
    int q = StdIn.readInt();
    if (!uf.connected(p, q))
    {
        uf.union(p, q);
        StdOut.println(p + " " + q);
    }
}
```

```
% more tinyUF.txt

1.5 UNION-FIND

Algorithms

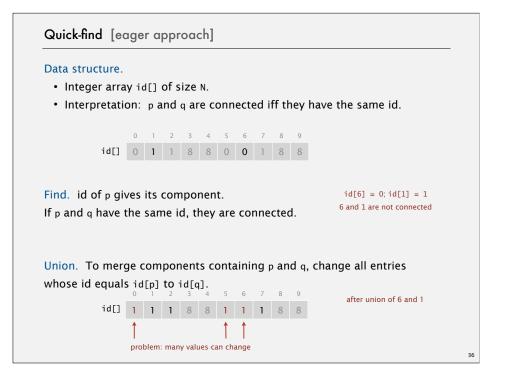

Auguick find

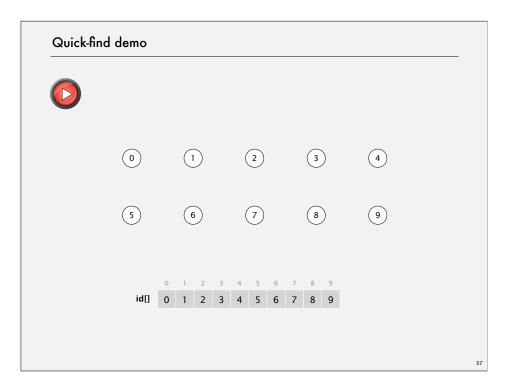

quick union

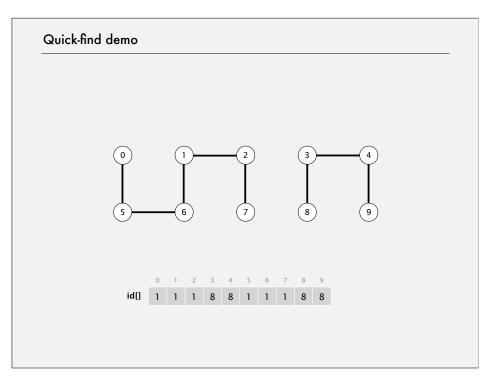

improvements

applications

http://algs4.cs.princeton.edu

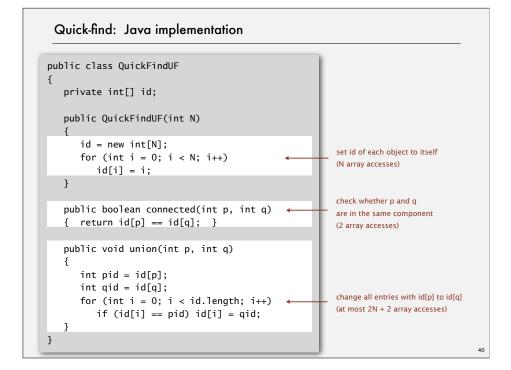

```
Quick-find: Java implementation

public class QuickFindUF {
  private int[] id;
  public QuickFindUF(int N) {
  }

  public boolean connected(int p, int q) {
  }

  public void union(int p, int q) {
  }
}
```

Quick-find is too slow

Cost model. Number of array accesses (for read or write).

algorithm	initialize	union	find
quick-find	N	N	1

order of growth of number of array accesses

quadratic

Union is too expensive. It takes N^2 array accesses to process a sequence of N union commands on N objects.

Quadratic algorithms do not scale

Rough standard (for now).

- 109 operations per second.
- 10⁹ words of main memory.
- Touch all words in approximately 1 second.

a truism (roughly)

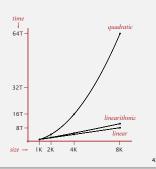

since 1950!

Ex. Huge problem for quick-find.

- 109 union commands on 109 objects.
- Quick-find takes more than 1018 operations.
- 30+ years of computer time!

Quadratic algorithms don't scale with technology.

- · New computer may be 10x as fast.
- But, has 10x as much memory ⇒
 want to solve a problem that is 10x as big.
- · With quadratic algorithm, takes 10x as long!

1.5 UNION-FIND

Algorithms

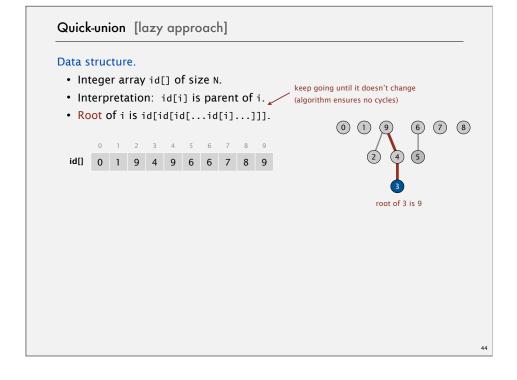

August find

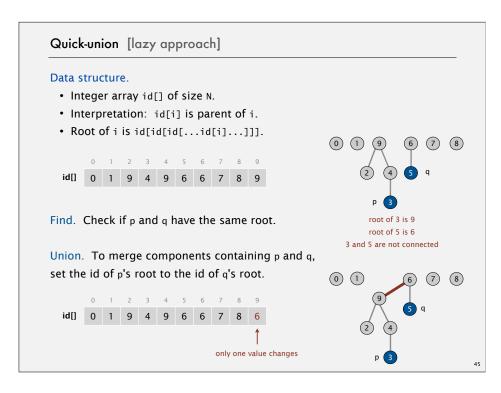

quick union

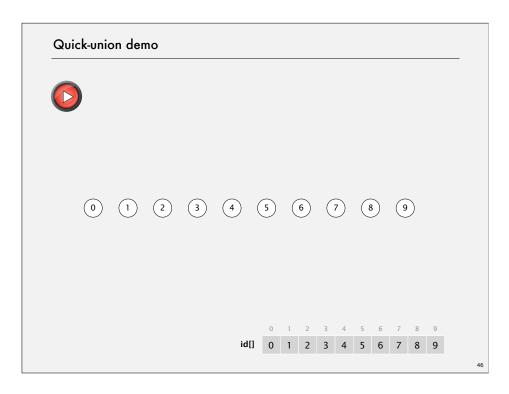

improvements

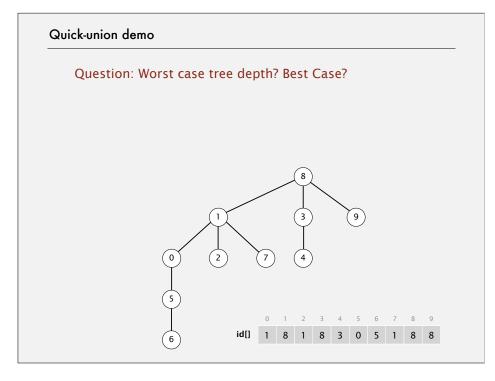

applications

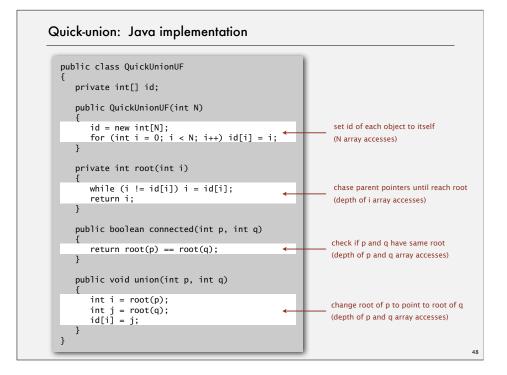

http://algs4.cs.princeton.edu

Quick-union is also too slow

Cost model. Number of array accesses (for read or write).

algorithm	initialize	union	find	
quick-find	N	N	1	
quick-union	N	Ν†	N	← worst case

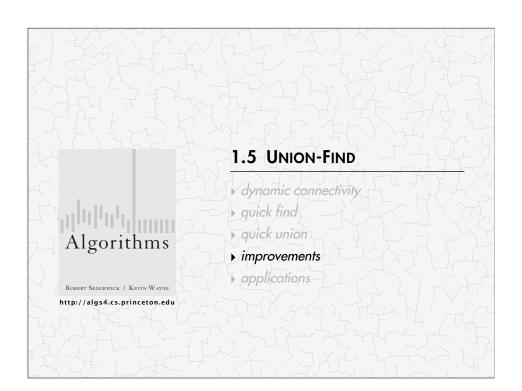

† includes cost of finding roots

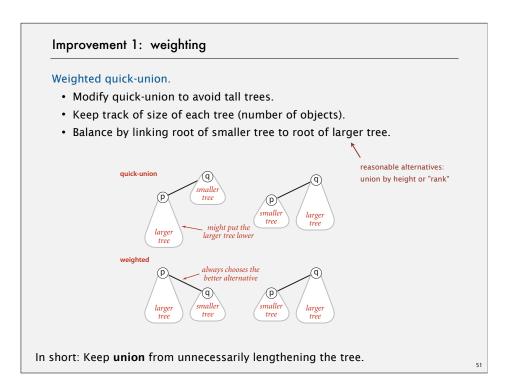

Quick-find defect.

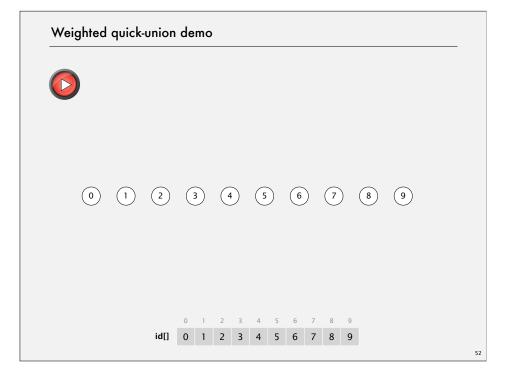

- Union too expensive (N array accesses).
- Trees are flat, but too expensive to keep them flat.

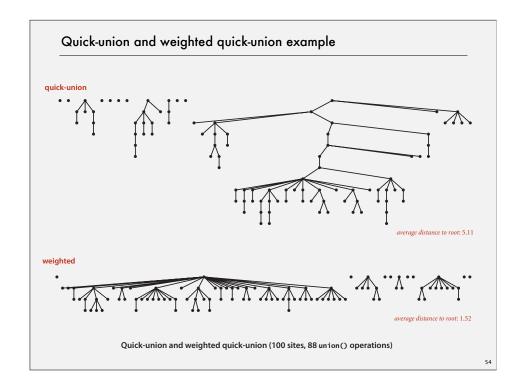

Quick-union defect.

- · Trees can get tall.
- Find too expensive (could be N array accesses).

Weighted quick-union: Java implementation

Data structure. Same as quick-union, but maintain extra array sz[i] to count number of objects in the tree rooted at i.

Find. Identical to quick-union.

Union. Modify quick-union to:

- · Link root of smaller tree to root of larger tree.
- Update the sz[] array.

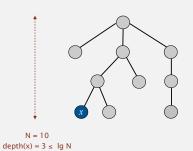

Weighted quick-union analysis

Running time.

- Find: takes time proportional to depth of p and q.
- · Union: takes constant time, given roots.

lg = base-2 logarithm

Proposition. Depth of any node x is at most $\lg N$.

Weighted quick-union analysis

Running time.

- Find: takes time proportional to depth of p and q.
- · Union: takes constant time, given roots.

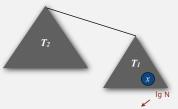

lg = base-2 logarithm

Proposition. Depth of any node x is at most $\lg N$.

Pf. When does depth of *x* increase?

Increases by 1 when tree T_1 containing x is merged into another tree T_2 .

- The size of the tree containing x at least doubles since $|T_2| \ge |T_1|$.
- Size of tree containing x can double at most $\lg N$ times. Why?

Size of tree containing x = 2*2*2*... = N

Weighted quick-union analysis

Running time.

- Find: takes time proportional to depth of p and q.
- · Union: takes constant time, given roots.

Proposition. Depth of any node x is at most $\lg N$.

algorithm	initialize	union	connected
quick-find	N	N	1
quick-union	N	N †	N
weighted QU	N	lg N †	lg N

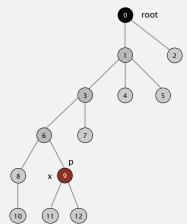

† includes cost of finding roots

- Q. Stop at guaranteed acceptable performance?
- A. No, easy to improve further.

58

Improvement 2: path compression

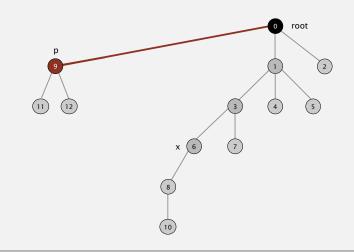

Quick union with path compression. Just after computing the root of p, set the id of each examined node to point to that root.

In short: Give find a side job compressing the tree.

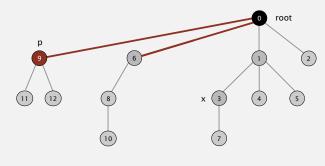

Improvement 2: path compression

Quick union with path compression. Just after computing the root of p, set the id of each examined node to point to that root.

Improvement 2: path compression

Quick union with path compression. Just after computing the root of p, set the id of each examined node to point to that root.

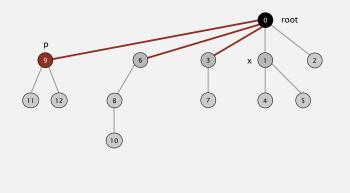

61

63

Improvement 2: path compression

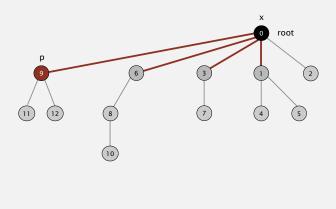

Quick union with path compression. Just after computing the root of p, set the id of each examined node to point to that root.

62

Improvement 2: path compression

Quick union with path compression. Just after computing the root of p, set the id[] of each examined node to point to that root.

Path compression: Java implementation

Two-pass implementation: add second loop to root() to set the id[] of each examined node to the root.

Simpler one-pass variant: Make every other node in path point to its grandparent (thereby halving path length).

```
private int root(int i)
{
    while (i != id[i])
    {
        id[i] = id[id[i]];
        i = id[i];
    }
    return i;
}
```

In practice. No reason not to! Keeps tree almost completely flat.

Weighted quick-union with path compression: amortized analysis

Proposition. [Hopcroft-Ulman, Tarjan] Starting from an empty data structure, any sequence of M union-find ops on N objects makes $\leq c(N+M\lg^* N)$ array accesses.

- Analysis can be improved to $N + M \alpha(M, N)$.
- Simple algorithm with fascinating mathematics.

lg* N
0
1
2
3
4
5

iterate log function

Linear-time algorithm for M union-find ops on N objects?

- · Cost within constant factor of reading in the data.
- · In theory, WQUPC is not quite linear.
- · In practice, WQUPC is linear.

Amazing fact. [Fredman-Saks] No linear-time algorithm exists.

in "cell-probe" model of computation

Summary

Key point. Weighted quick union (with path compression) makes it possible to solve problems that could not otherwise be addressed.

algorithm	worst-case time	
quick-find	MN	
quick-union	MN	
weighted QU	N + M log N	
QU + path compression	N + M log N	
weighted QU + path compression	N + M lg* N	

order of growth for M union-find operations on a set of N objects

Ex. [109 unions and finds with 109 objects]

- · WQUPC reduces time from 30 years to 6 seconds.
- · Supercomputer won't help much; good algorithm enables solution.

Union-find applications

- · Percolation.
- · Games (Go, Hex).
- ✓ Dynamic connectivity.
- · Least common ancestor.
- · Equivalence of finite state automata.
- · Hoshen-Kopelman algorithm in physics.
- · Hinley-Milner polymorphic type inference.
- · Kruskal's minimum spanning tree algorithm.
- · Compiling equivalence statements in Fortran.
- · Morphological attribute openings and closings.
- Matlab's bwlabel() function in image processing.

1.5 UNION-FIND

dynamic connectivity y guick find

- y guick union
- > improvements
- applications

ROBERT SEDGEWICK | KEVIN WAYNE

http://algs4.cs.princeton.edu

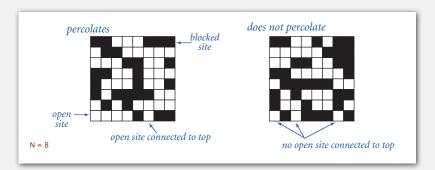

Percolation

An abstract model for many physical systems:

- N-by-N grid of sites.
- Each site is open with probability p (or blocked with probability 1-p).
- System percolates iff top and bottom are connected by open sites.

60

Percolation

An abstract model for many physical systems:

- N-by-N grid of sites.
- Each site is open with probability p (or blocked with probability 1-p).
- System percolates iff top and bottom are connected by open sites.

model	system	vacant site	occupied site	percolates
electricity	material	conductor	insulated	conducts
fluid flow	material	empty	blocked	porous
social interaction	population	person	empty	communicates

70

Likelihood of percolation

Depends on site vacancy probability p.

p low (0.4) does not percolate

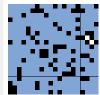

p medium (0.6) percolates?

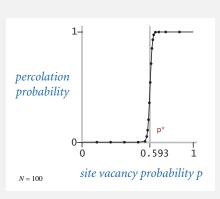

p high (0.8) percolates

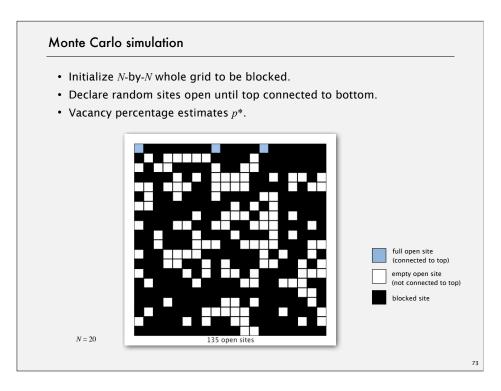

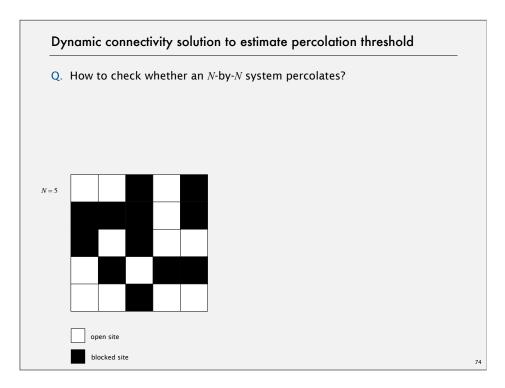

Percolation phase transition

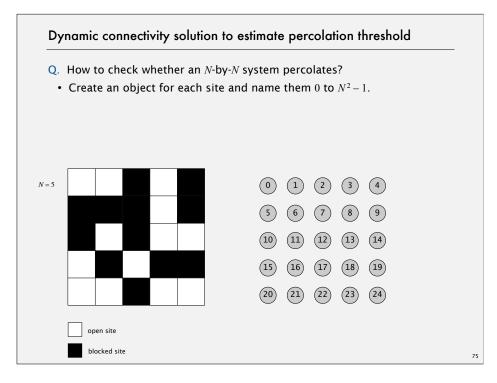

When N is large, theory guarantees a sharp threshold p^* .

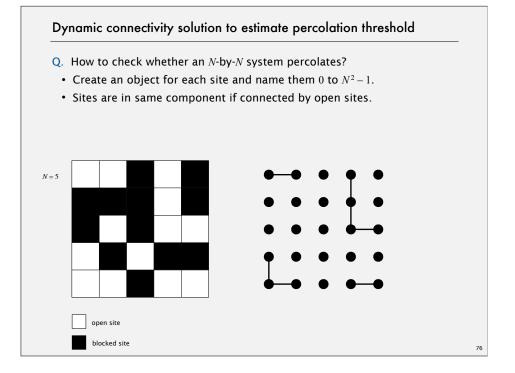

- $p > p^*$: almost certainly percolates.
- $p < p^*$: almost certainly does not percolate.
- Q. What is the value of p^* ?

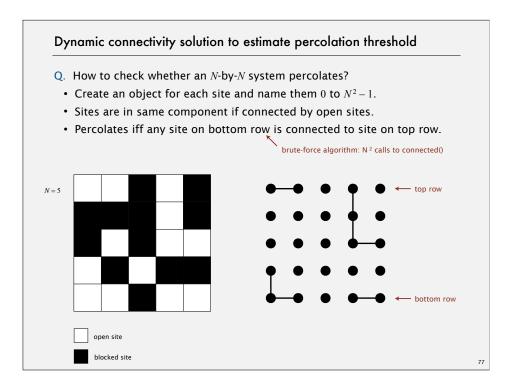

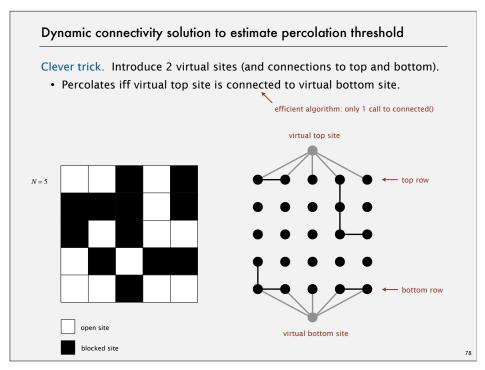

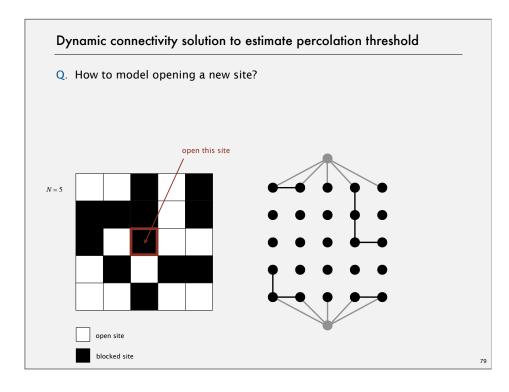

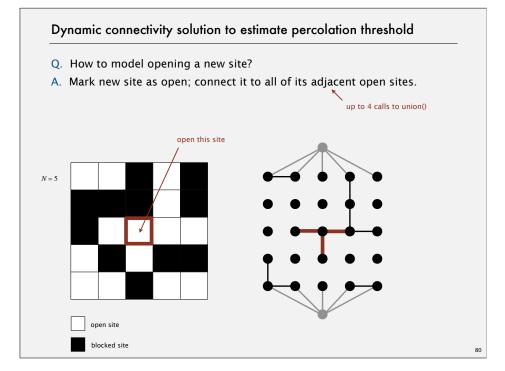

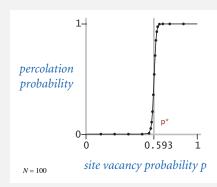

Percolation threshold

- Q. What is percolation threshold p^* ?
- A. About 0.592746 for large square lattices.

constant known only via simulation

Fast algorithm enables accurate answer to scientific question.
