Directed graphs

Digraph. Set of vertices connected pairwise by directed edges.

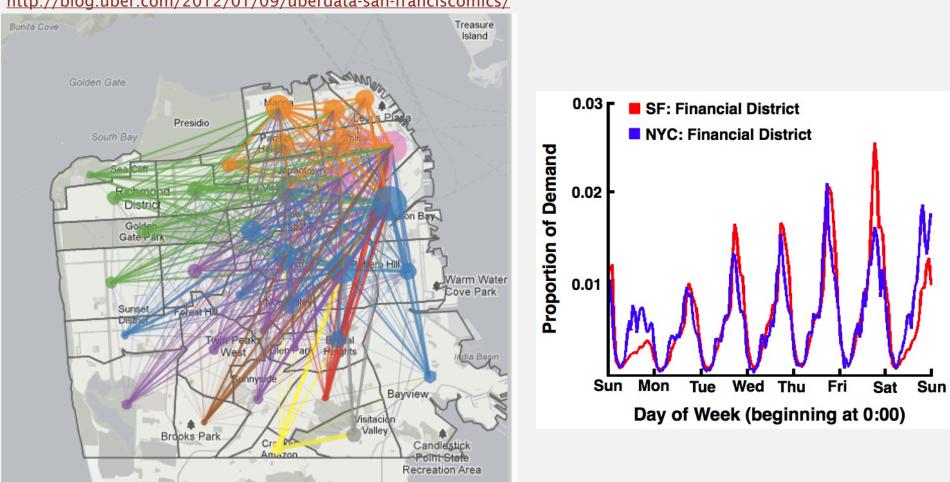

Road network

Vertex = intersection; edge = one-way street.

Taxi flow patterns (Uber)

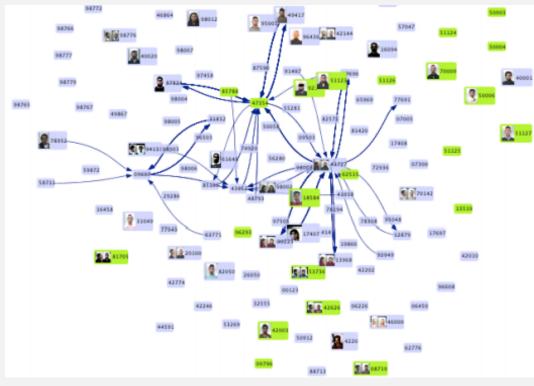

http://blog.uber.com/2012/01/09/uberdata-san-franciscomics/

Uber cab service

- Left Digraph: Color is the source neighborhood (no arrows).
- Right Plot: Digraph analysis shows financial districts have similar demand.

Reverse engineering criminal organizations (LogAnalysis)

"The analysis of reports supplied by mobile phone service providers makes it possible to reconstruct the network of relationships among individuals, such as in the context of criminal organizations. It is possible, in other terms, to unveil the existence of criminal networks, sometimes called rings, identifying actors within the network together with their roles" — Cantanese et. al

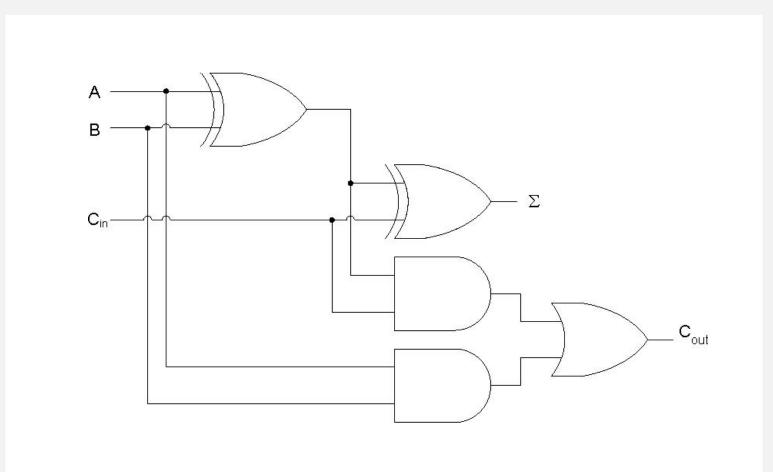

Forensic Analysis of Phone Call Networks, Salvatore Cantanese, http://arxiv.org/abs/1303.1827

Field	Description
IMEI	IMEI code MS
called	called user
calling	calling user
date/time start	date/time start calling (GMT)
date/time end	date/time end calling (GMT)
type	sms, mms, voice, data etc.
IMSI	calling or called SIM card
CGI	Lat. long. BTS company

Table 1 An example of the structure of a log file.

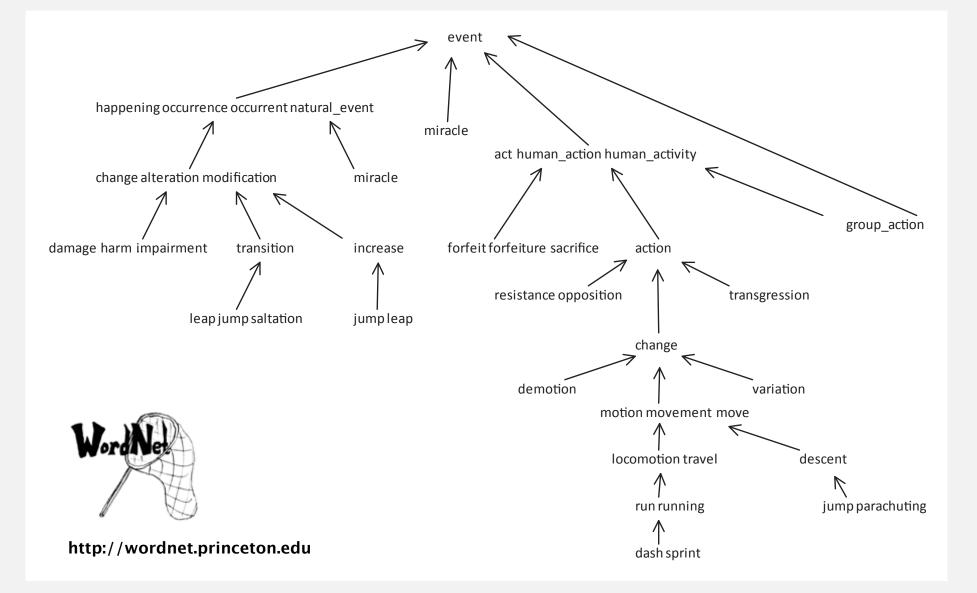

Combinational circuit

Vertex = logical gate; edge = wire.

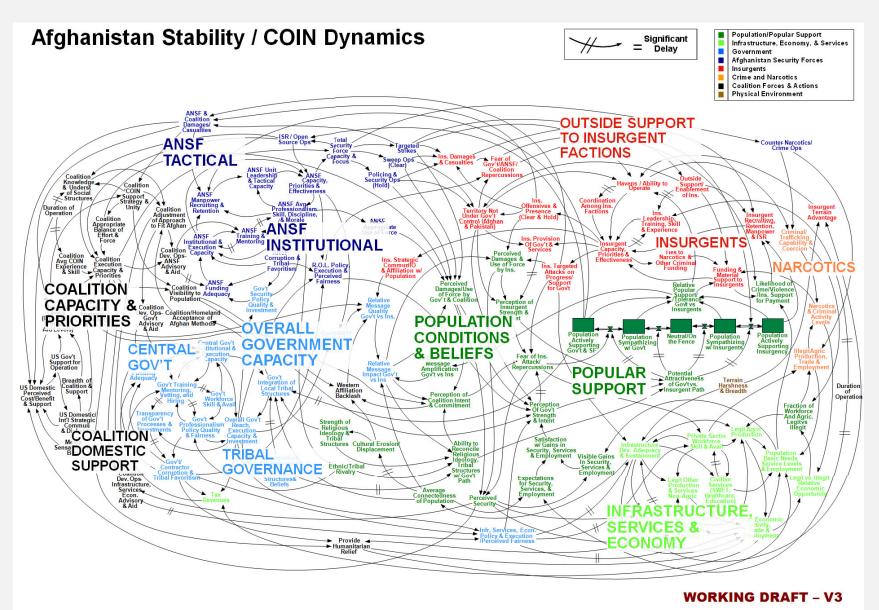

WordNet graph

Vertex = synset; edge = hypernym relationship.

The McChrystal Afghanistan PowerPoint slide

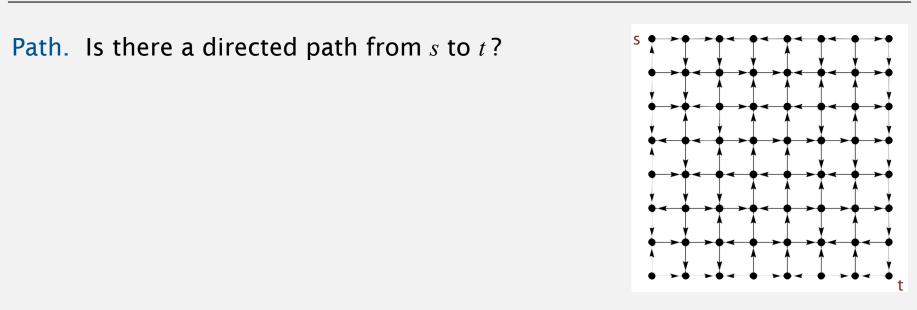

Page 22

http://www.guardian.co.uk/news/datablog/2010/apr/29/mcchrystal-afghanistan-powerpoint-slide

Digraph applications

digraph	vertex	directed edge	
transportation	street intersection	one-way street	
web	web page	hyperlink	
food web	species	predator-prey relationship	
WordNet	synset	hypernym	
scheduling	task	precedence constraint	
financial	bank	transaction	
cell phone	person	placed call	
infectious disease	person	infection	
game	board position	legal move	
citation	journal article	citation	
object graph	object	pointer	
inheritance hierarchy	class	inherits from	
control flow	code block	jump	

Some digraph problems

Shortest path. What is the shortest directed path from *s* to *t*?

Topological sort. Can you draw a digraph so that all edges point upwards?

Strong connectivity. Is there a directed path between all pairs of vertices?

Transitive closure. For which vertices *v* and *w* is there a path from *v* to *w*?

PageRank. What is the importance of a web page?

Digraph API

public class	Digraph	
	Digraph(int V)	create an empty digraph with V vertices
	Digraph(In in)	create a digraph from input stream
void	addEdge(int v, int w)	add a directed edge $v \rightarrow w$
Iterable <integer></integer>	adj(int v)	vertices pointing from v
int	V()	number of vertices
int	Ε()	number of edges
Digraph	reverse()	reverse of this digraph
String	toString()	string representation

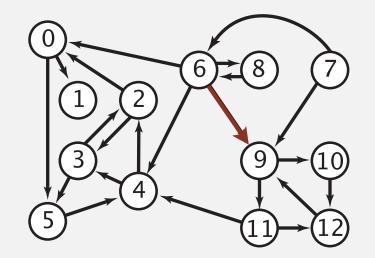

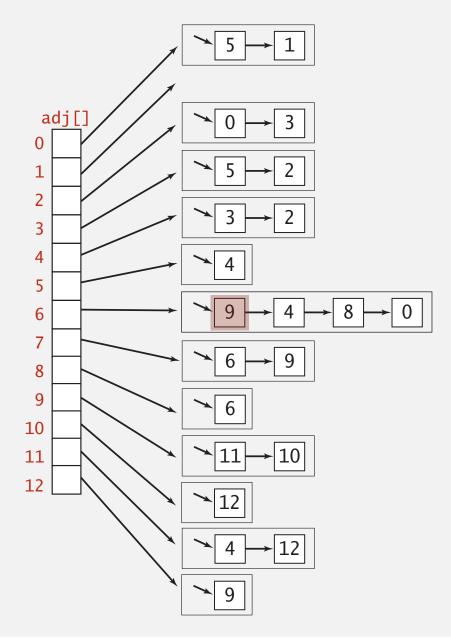

Digraph API

Adjacency-lists digraph representation

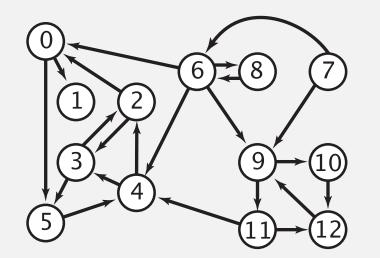

Maintain vertex-indexed array of lists.

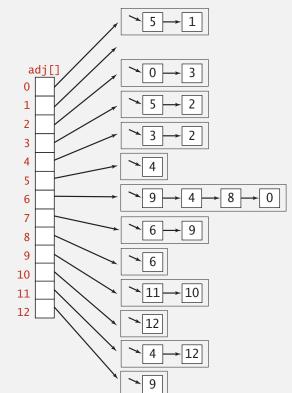

Do you slumber?

Suppose we are given an arbitrary Digraph G and a path of length V given by int[] P.

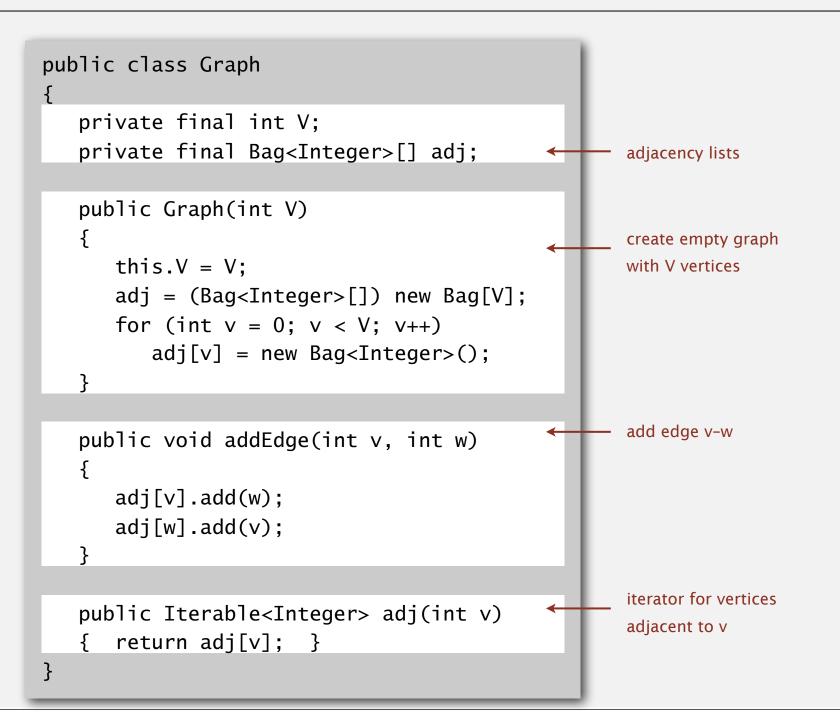

0542316879101112

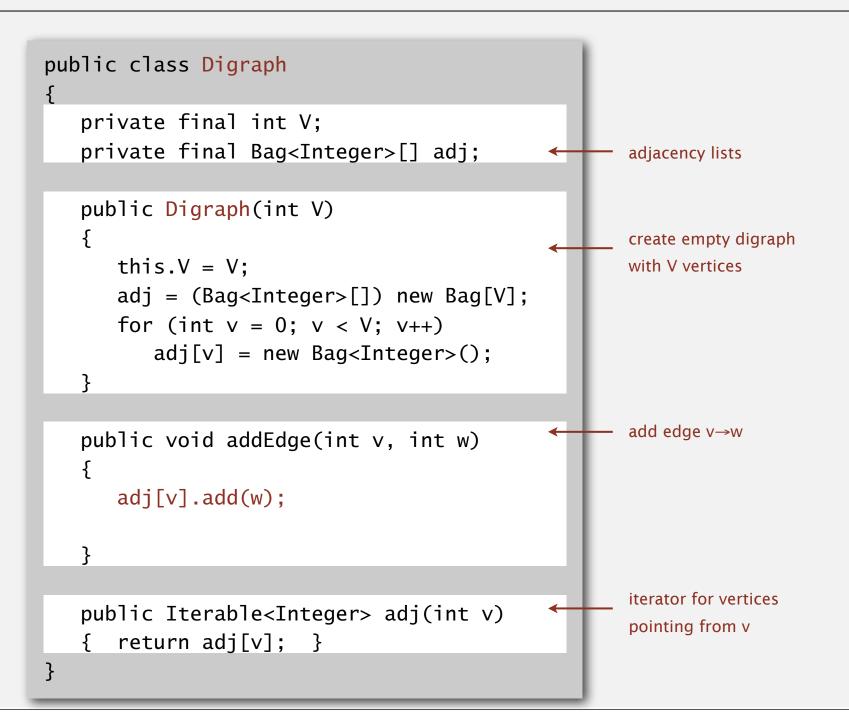

pollEv.com/jhugtext to 37607Q: What is the worst case run time to check validity of a path P for ageneral graph with V vertices?A. 1[445 655]B. V[445 656]

Adjacency-lists graph representation (review): Java implementation

Adjacency-lists digraph representation: Java implementation

Digraph representations

In practice. Use adjacency-lists representation.

- Algorithms based on iterating over vertices pointing from v.
- Real-world digraphs tend to be sparse.

huge number of vertices, small average vertex degree

representation space		insert edge from v to w	edge from v to w?	iterate over vertices pointing from v?	
list of edges	E	1	E	E	
adjacency matrix	V ²	1 †	1	V	
adjacency lists	E + V	1	outdegree(v)	outdegree(v)	

[†] disallows parallel edges

Algorithms

Robert Sedgewick | Kevin Wayne

http://algs4.cs.princeton.edu

Reachability

Problem. Find all vertices reachable from *s* along a directed path.

Depth-first search in digraphs

Same method as for undirected graphs.

- Every undirected graph is a digraph (with edges in both directions).
- DFS is a digraph algorithm.

DFS (to visit a vertex v)

Mark v as visited.

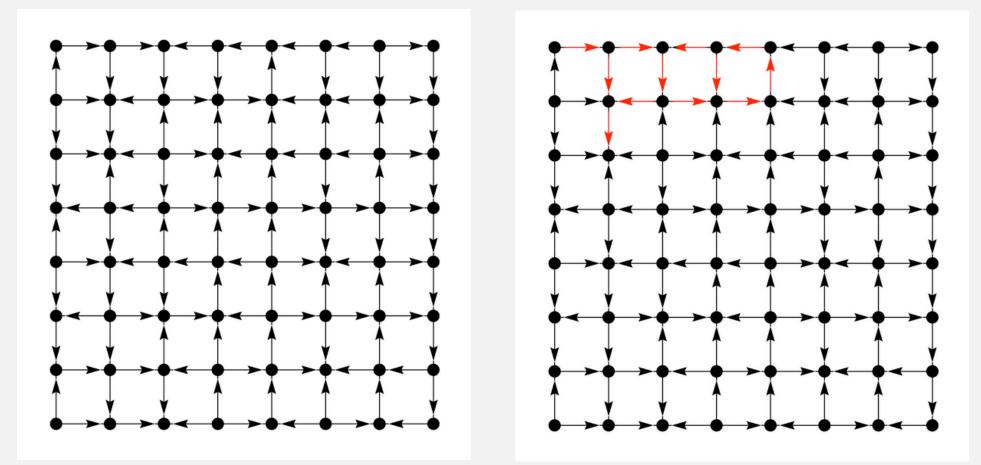

Recursively visit all unmarked

vertices w pointing from v.

Difficulty level.

- Exactly the same problem for computers.
- Harder for humans than undirected graphs.
 - Edge interpretation is context dependent!

The man-machine

Difficulty level.

- Exactly the same problem for computers.
- Harder for humans than undirected graphs.
 - Edge interpretation is context dependent!

Depth-first search demo

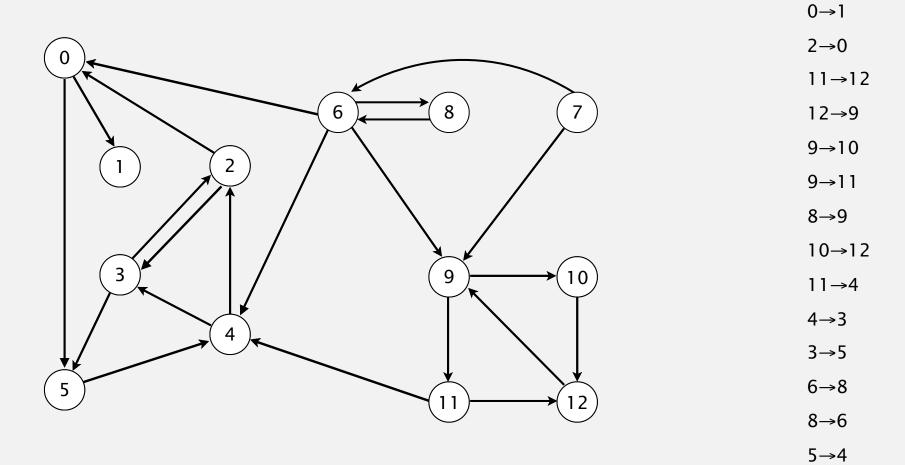

• Mark vertex *v* as visited.

To visit a vertex v :

4→2 2→3

3→2

- Recursively visit all unmarked vertices pointing from v. $6 \rightarrow 0$

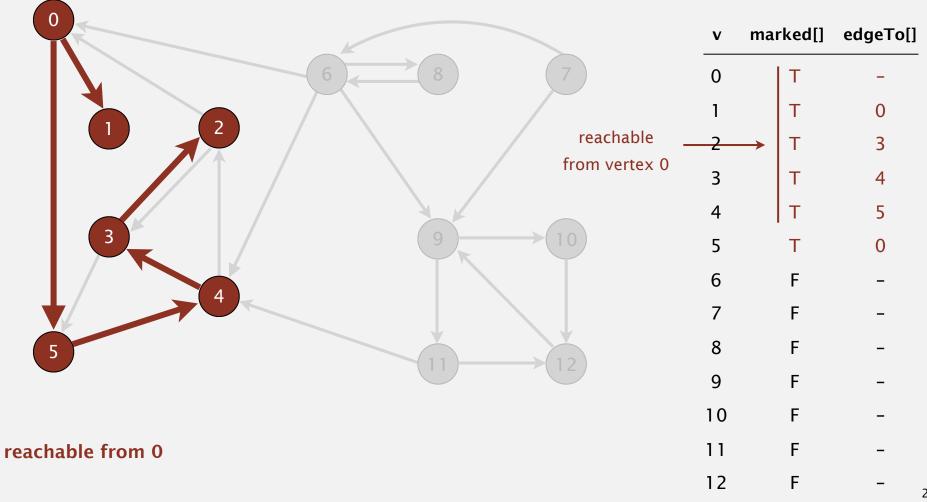

a directed graph

0→5 6→4

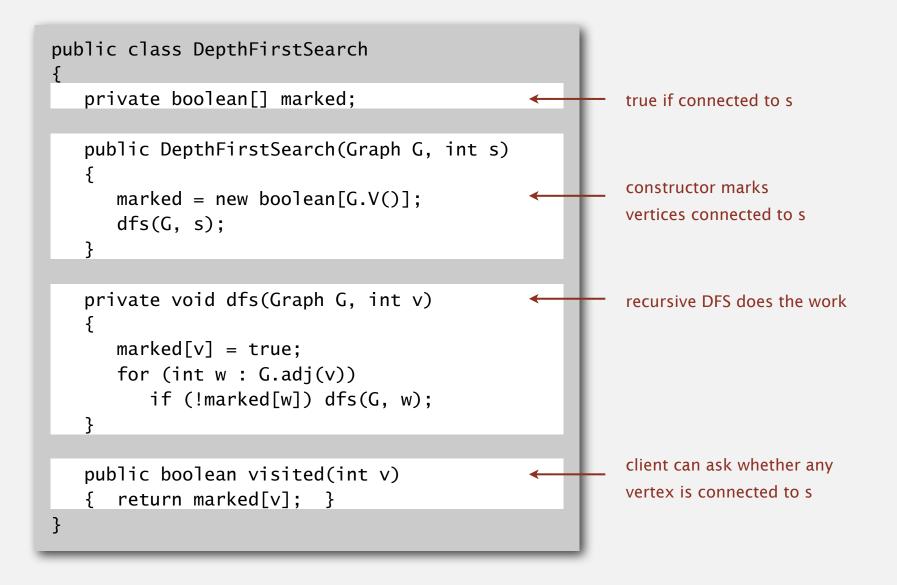

Depth-first search demo

To visit a vertex *v* :

- Mark vertex v as visited.
- Recursively visit all unmarked vertices pointing from v.

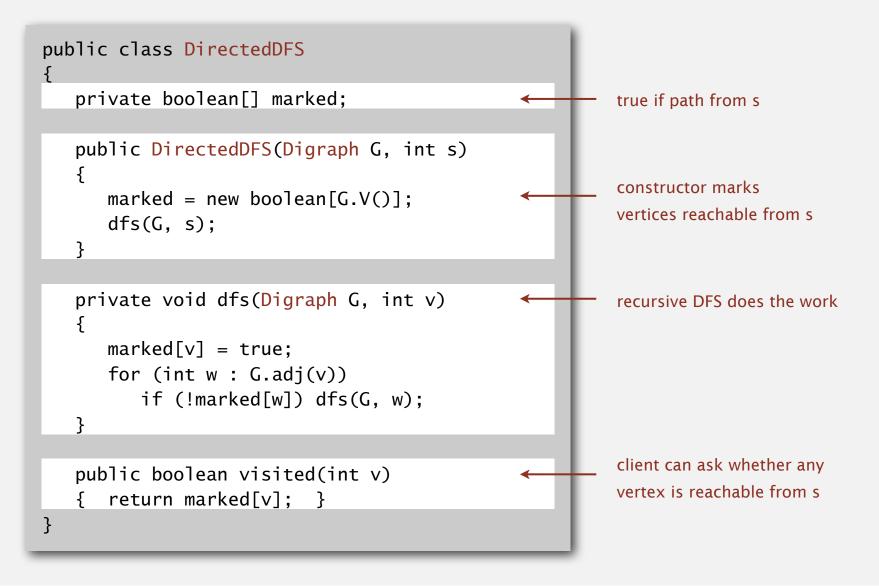

Recall code for undirected graphs.

Depth-first search (in directed graphs)

Code for directed graphs identical to undirected one.

[substitute Digraph for Graph]

Reachability application: program control-flow analysis

Every program is a digraph.

- Vertex = basic block of instructions (straight-line program).
- Edge = jump.

Dead-code elimination.

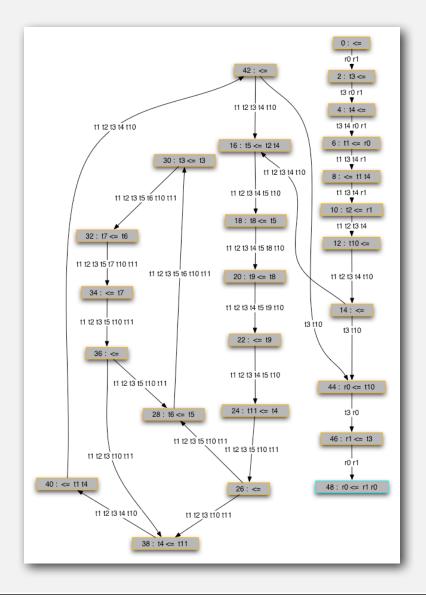

Find (and remove) unreachable code.

• Cow.java:5: unreachable statement

Infinite-loop detection.

Determine whether exit is unreachable.

- Trivial?
- Doable by student?
- Doable by expert?
- Intractable?
- Unknown?
- Impossible?

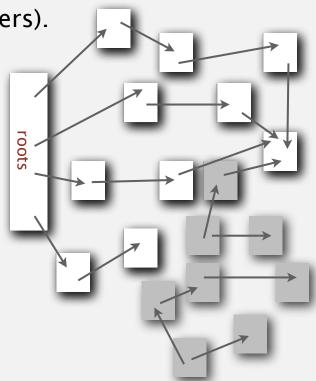

Reachability application: mark-sweep garbage collector

Every data structure is a digraph.

- Vertex = object.
- Edge = reference.

Roots. Objects known to be directly accessible by program (e.g., stack).

Reachable objects. Objects indirectly accessible by program (starting at a root and following a chain of pointers).

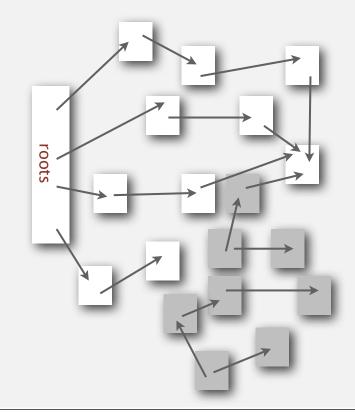

Reachability application: mark-sweep garbage collector

Mark-sweep algorithm. [McCarthy, 1960]

- Mark: mark all reachable objects.
- Sweep: if object is unmarked, it is garbage (so add to free list).

Memory cost. Uses 1 extra mark bit per object (plus DFS stack).

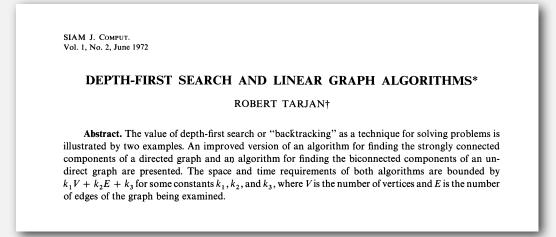

Depth-first search in digraphs summary

DFS enables direct solution of simple digraph problems.

- Reachability.
 - Path finding.
 - Topological sort.
 - Directed cycle detection.

Basis for solving difficult digraph problems.

- 2-satisfiability.
- Directed Euler path.
- Strongly-connected components.

Breadth-first search in digraphs

Same method as for undirected graphs.

- Every undirected graph is a digraph (with edges in both directions).
- BFS is a digraph algorithm.

RLS	(from source vertex s)
Put	s onto a FIFO queue, and mark s as visited.
Rep	peat until the queue is empty:
-	remove the least recently added vertex v
-	for each unmarked vertex pointing from v:
	add to queue and mark as visited.

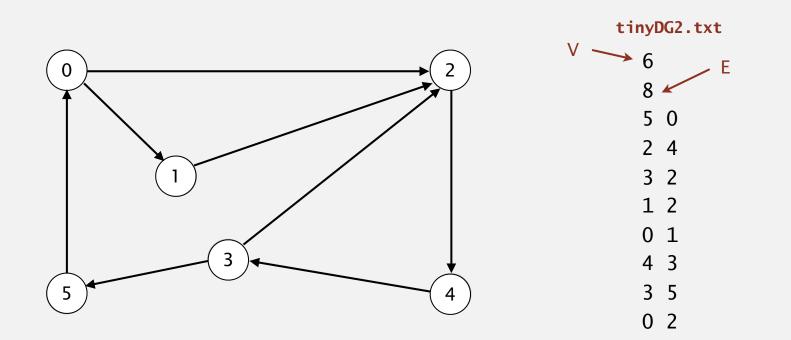

Proposition. BFS computes shortest paths (fewest number of edges) from *s* to all other vertices in a digraph in time proportional to E + V.

Directed breadth-first search demo

Repeat until queue is empty:

• Remove vertex *v* from queue.

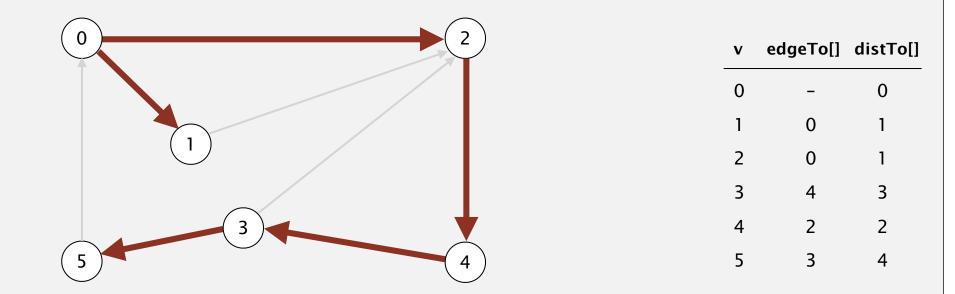

Directed breadth-first search demo

Repeat until queue is empty:

- Remove vertex *v* from queue.
- Add to queue all unmarked vertices pointing from *v* and mark them.

done

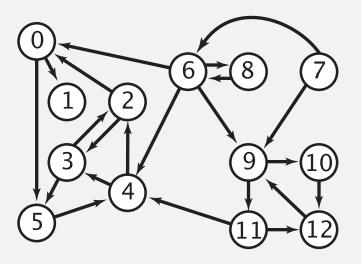

Multiple-source shortest paths

Multiple-source shortest paths. Given a digraph and a set of source vertices, find shortest path from any vertex in the set to each other vertex.

Ex. $S = \{ 1, 7, 10 \}.$

•

- Shortest path to 4 is $7 \rightarrow 6 \rightarrow 4$.
- Shortest path to 5 is $7 \rightarrow 6 \rightarrow 0 \rightarrow 5$.
- Shortest path to 12 is $10 \rightarrow 12$.

- Q. How to implement multi-source shortest paths algorithm?
- A. Use BFS, but initialize by enqueuing all source vertices.

Java implementation of BFS

```
public class BreadthFirstPaths
{
    private boolean[] marked;
    private int[] edgeTo;
    private int[] distTo;
    ...
    private void bfs(Digraph G, int s) {
    }
}
```

Java implementation of BFS

```
public class BreadthFirstPaths
{
   private boolean[] marked;
   private int[] edgeTo;
   private int[] distTo;
   ...
   private void bfs(Digraph G, Iterable<Integer> sources) {
      Queue<Integer> q = new Queue<Integer>();
      for (int s : sources) {
          q.enqueue(s);
          marked[s] = true;
          distTo[s] = 0;
      }
      while (!q.isEmpty()) {
         int v = q.dequeue();
         for (int w : G.adj(v)) {
            if (!marked[w]) {
               q.enqueue(w);
               marked[w] = true;
               edgeTo[w] = v;
               distTo[w] = distTo[v] + 1;
            }
         }
      }
   }
}
```

Java implementation of BFS

```
private void mysterySearch(Graph G, Iterable<Integer> sources) {
  Stack<Integer> q = new Stack<Integer>();
  for (int s : sources) {
       q.push(s);
       marked[s] = true;
   }
  while (!q.isEmpty()) {
      int v = q.pop();
      for (int w : G.adj(v)) {
         if (!marked[w]) {
            q.push(w);
            marked[w] = true;
         }
      }
  }
}
```

Problem to be discussed at beginning of class Tuesday, November 12th

Q: What sort of search does the code above perform?

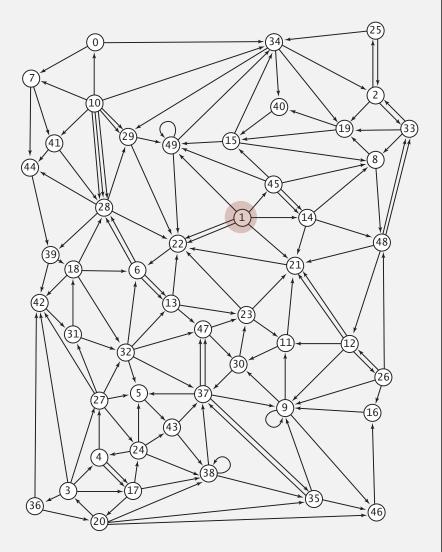

- A. DFS
- B. BFS
- C. Some other type of search

Breadth-first search in digraphs application: web crawler

Goal. Crawl web, starting from some root web page, say www.princeton.edu.

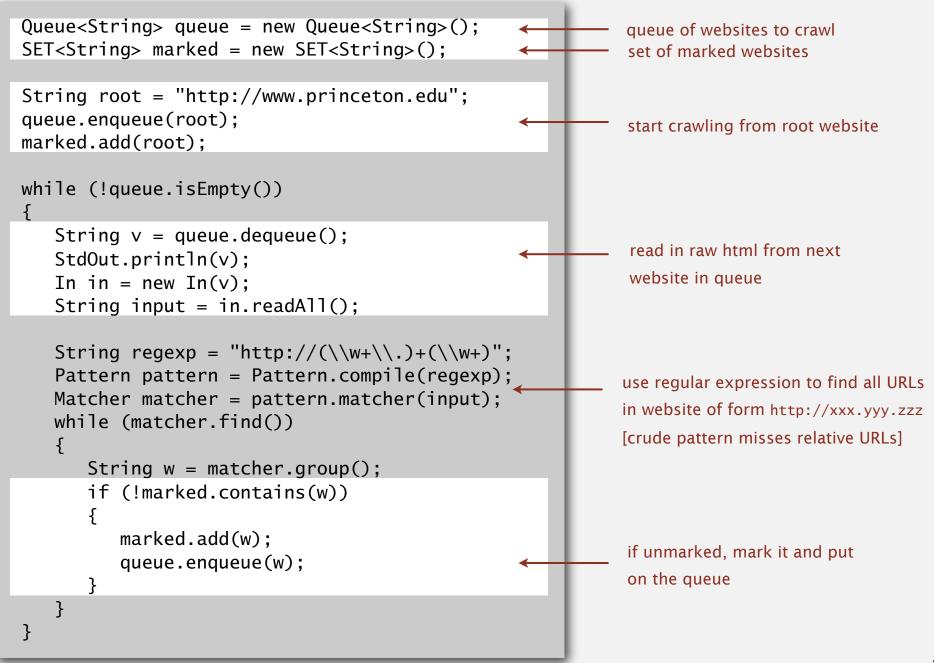

Solution. [BFS with implicit digraph]

- Choose root web page as source *s*.
- Maintain a Queue of websites to explore.
- Maintain a SET of discovered websites.
- Dequeue the next website and enqueue websites to which it links (provided you haven't done so before).

Q. Why not use DFS?

Bare-bones web crawler: Java implementation

4.2 DIRECTED GRAPHS

introduction

digraph API

digraph search

topological sort

strong components

Algorithms

Robert Sedgewick | Kevin Wayne

http://algs4.cs.princeton.edu

Depth first orders

Observation. Depth first search visits (marks) each vertex exactly once.

• Order in which these visits occur can be useful

Orderings.

- Preorder: Put vertex on a queue before recursive call.
- Postorder: Put vertex on a queue after recursive call.
- Reverse Postorder: Put vertex on a stack after recursive call.

Examples.

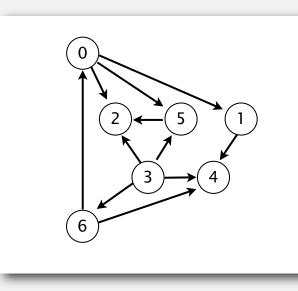

- Written on board.
- Alternately: See book chapter 4.2.

Precedence scheduling

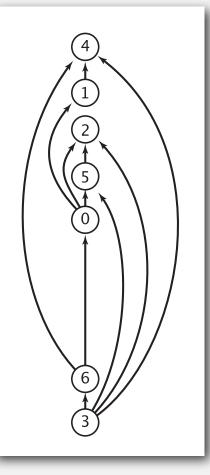

Goal. Given a set of tasks to be completed with precedence constraints, in which order should we schedule the tasks?

Digraph model. vertex = task; edge = precedence constraint.

- 0. Algorithms
- 1. Complexity Theory
- 2. Artificial Intelligence
- 3. Intro to CS
- 4. Cryptography
- 5. Scientific Computing
- 6. Advanced Programming

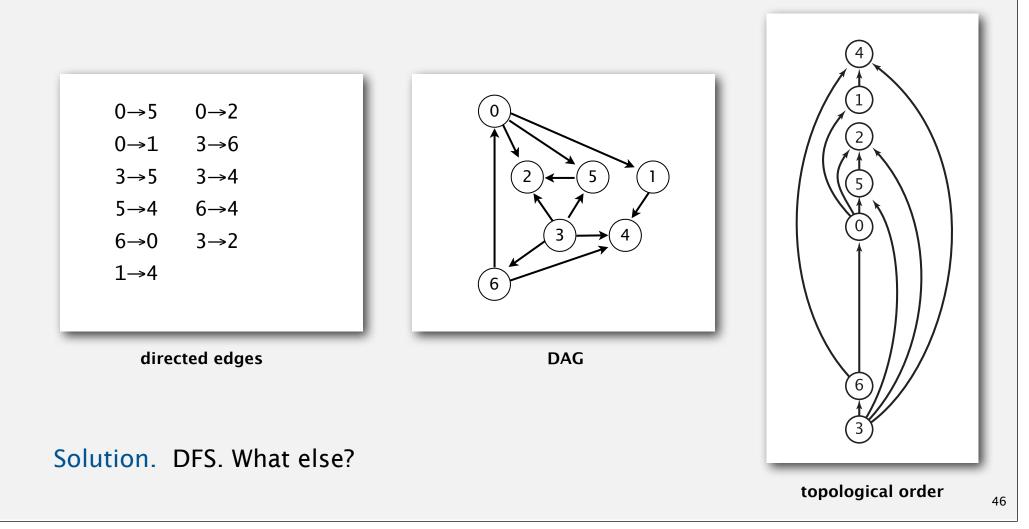

precedence constraint graph

feasible schedule

DAG. Directed acyclic graph.

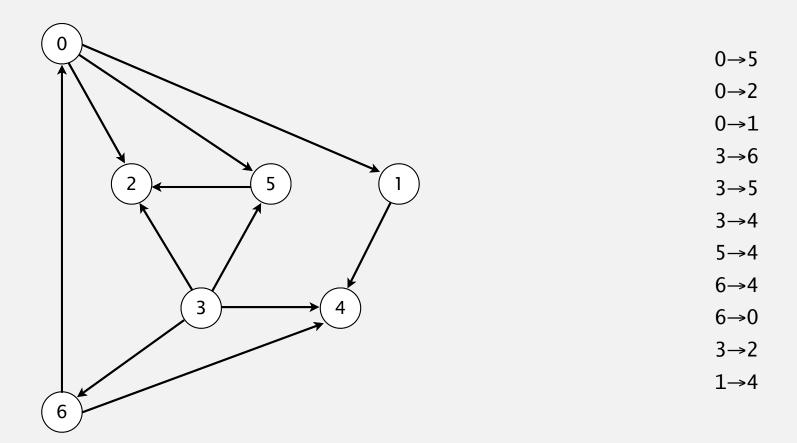

Topological sort. Redraw DAG so all edges point upwards.

Topological sort demo

- Run depth-first search.
- Return vertices in reverse postorder.

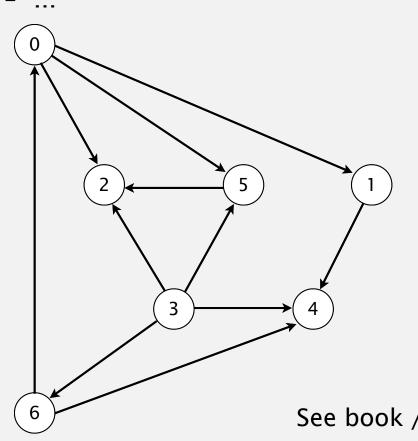

a directed acyclic graph

Topological sort intuitive proof

- Run depth-first search.
- Return vertices in reverse postorder.
- Why does it work?
 - Last item in postorder has indegree 0. Good starting point.
 - Second to last can only be pointed to by last item. Good follow-up.

postorder

why?

4 1 2 5 0 6 3

topological order

3 6 0 5 2 1 4

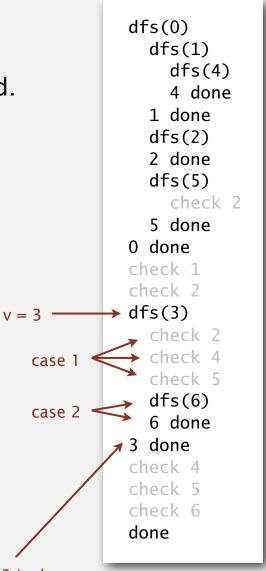

See book / online slides for foolproof full proof.

More honest proof that reverse postorder is a topological order

Proposition. Reverse DFS postorder of a DAG is a topological order.

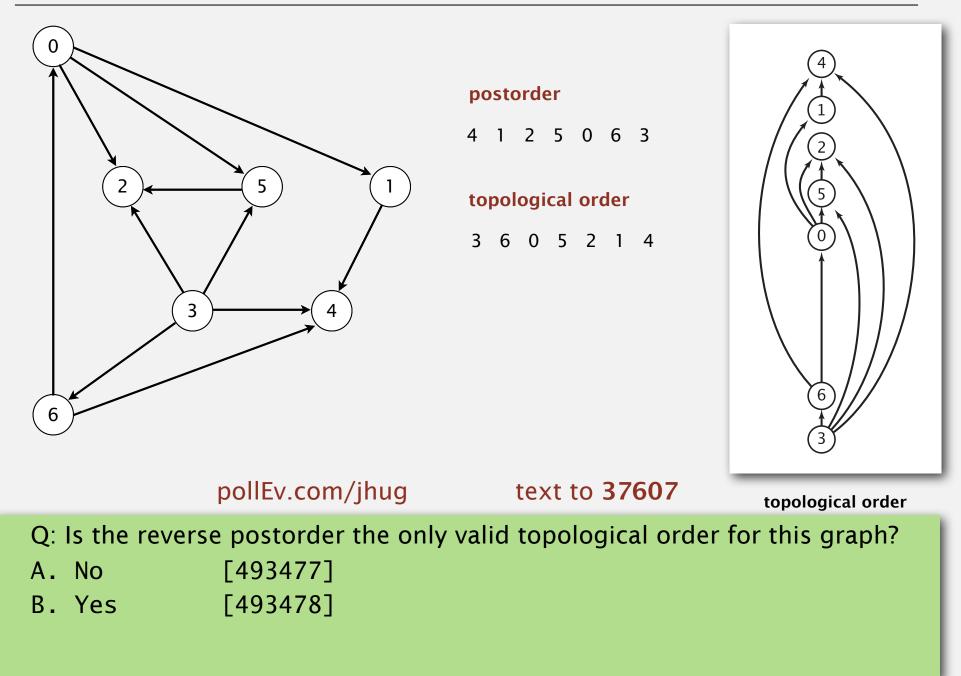

Pf. Consider any edge $v \rightarrow w$. When dfs(v) is called:

- Case 1: dfs(w) has already been called and returned. Thus, w was done before v.
- Case 2: dfs(w) has not yet been called.
 dfs(w) will get called directly or indirectly
 by dfs(v) and will finish before dfs(v).
 Thus, w will be done before v.
- Case 3: dfs(w) has already been called, but has not yet returned.
 Can't happen in a DAG: function call stack contains path from w to v, so v→w would complete a cycle.

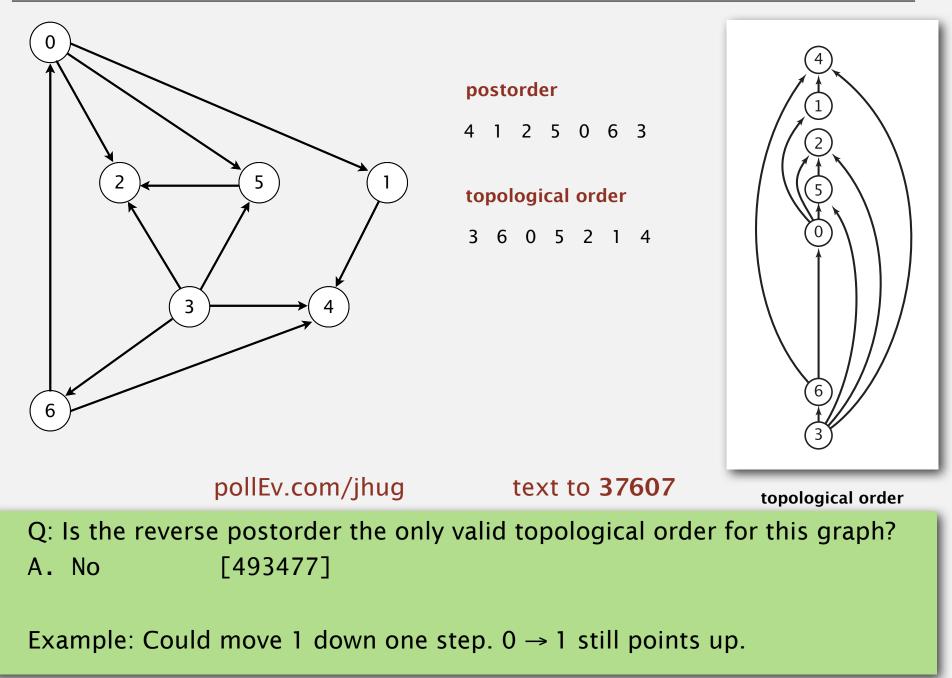

all vertices pointing from 3 are done before 3 is done, so they appear after 3 in topological order

Topological sort demo

Topological sort demo

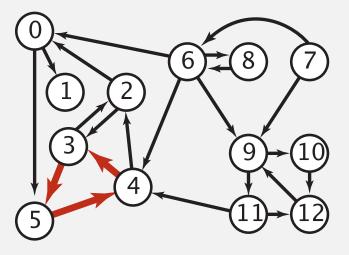

```
public class DepthFirstOrder
   private boolean[] marked;
   private Stack<Integer> reversePost;
   public DepthFirstOrder(Digraph G)
      reversePost = new Stack<Integer>();
      marked = new boolean[G.V()];
      for (int v = 0; v < G.V(); v++)
         if (!marked[v]) dfs(G, v);
   }
   private void dfs(Digraph G, int v)
      marked[v] = true;
      for (int w : G.adj(v))
         if (!marked[w]) dfs(G, w);
      reversePost.push(v);
   }
   public Iterable<Integer> reversePost()
                                                      returns all vertices in
   { return reversePost; }
                                                      "reverse DFS postorder"
```

Directed cycle detection

Proposition. A digraph has a topological order iff no directed cycle. Pf.

- If directed cycle, topological order impossible.
- If no directed cycle, DFS-based algorithm finds a topological order.

a digraph with a directed cycle

Goal. Given a digraph, find a directed cycle. Solution. DFS. What else? See textbook.

Directed cycle detection application: cyclic inheritance

The Java compiler does cycle detection.

```
public class A extends B
{
    ...
}
```

public class B extends C
{
 ...
}

```
public class C extends A
{
    ...
}
```

Directed cycle detection application: spreadsheet recalculation

Microsoft Excel does cycle detection (and has a circular reference toolbar!)

4.2 DIRECTED GRAPHS

Algorithms

strong components

introduction

digraph API

digraph search

topological sort

Robert Sedgewick | Kevin Wayne

http://algs4.cs.princeton.edu

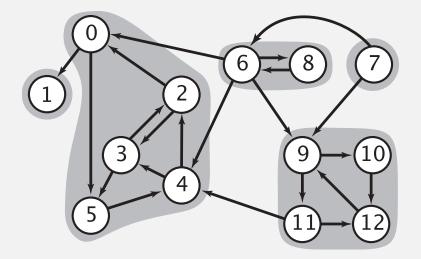

Strongly-connected components

Def. Vertices *v* and *w* are strongly connected if there is both a directed path from *v* to *w* and a directed path from *w* to *v*. Every node is strongly connected to itself.

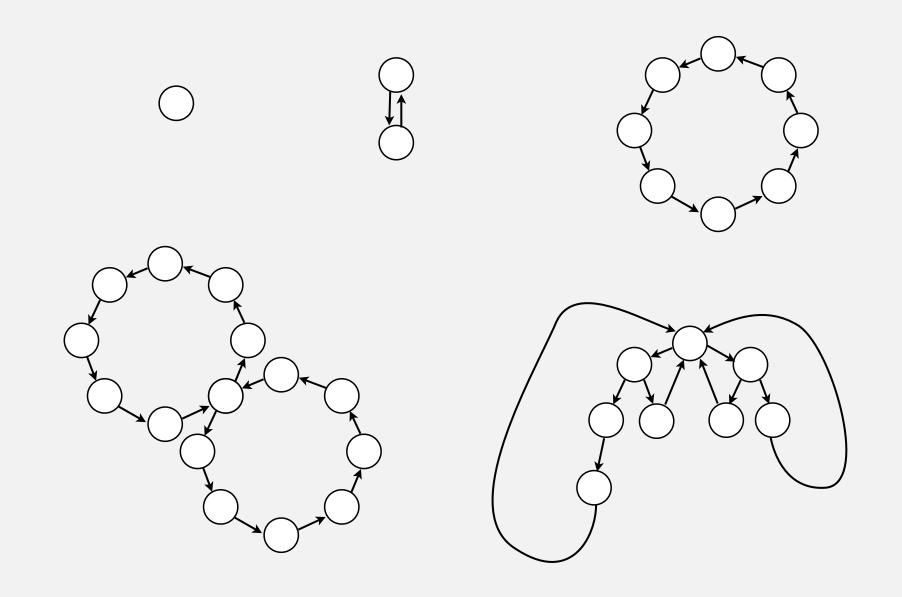

Key property. Strong connectivity is an equivalence relation:

- *v* is strongly connected to *v*.
- If v is strongly connected to w, then w is strongly connected to v.
- If v is strongly connected to w and w to x, then v is strongly connected to x.

Def. A strong component is a maximal subset of strongly-connected vertices.

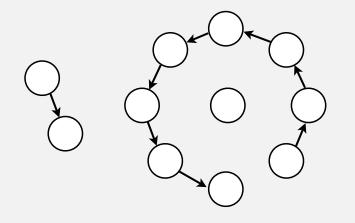

Examples of strongly-connected digraphs: 1 strong component

Strongly-connected components

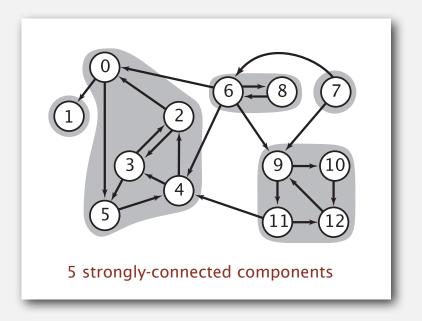

Def. Vertices *v* and *w* are strongly connected if there is both a directed path from *v* to *w* and a directed path from *w* to *v*. Every node is strongly connected to itself.

	pollEv.com/jhug	text to 3	37607
Q: How ma	any strong components does	a DAG on V ve	rtices and E edges have?
A. 0	[494241]	С. Е	[494243]
B. 1	[494242]	D. V	[494246]

Connected components vs. strongly-connected components

- v and w are connected if there is a path between v and w 3 connected components how?? connected component id (trivial to compute with DFS) id[] 0 1 2 3 4 5 6 7 8 9 10 11 12 0 0 0 0 0 0 1 1 1 2 2 2 2 2 public int connected(int v, int w) return id[v] == id[w]; } { constant-time client connectivity query
 - v and w are strongly connected if there is both a directed path from v to w and a directed path from w to v

strongly-connected component id (how to compute?)

	0	1	2	3	4	5	6	7	8	9	10	11	12
id[]	1	0	1	1	1	1	3	4	3	2	2	2	2

public int stronglyConnected(int v, int w)
{ return id[v] == id[w]; }

constant-time client strong-connectivity query

Strongly connected components

Analysis of Yahoo Answers

- Edge is from asker to answerer.
- "A large SCC indicates the presence of a community where many users interact, directly or indirectly."

Table 1: Summary statistics for selected QA networks

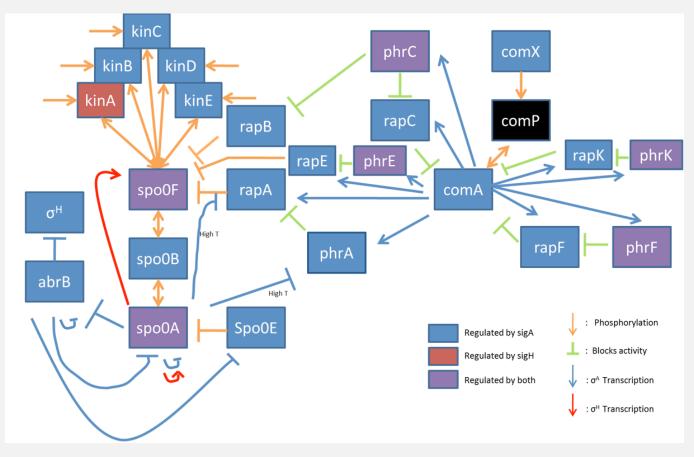

Category	Nodes	Edges	Avg.	Mutual	SCC
			deg.	edges	
Wrestling	9,959	56,859	7.02	1,898	13.5%
Program.	12,538	18,311	1.48	0	0.01%
Marriage	$45,\!090$	$164,\!887$	3.37	179	4.73%

Knowledge sharing and yahoo answers: everyone knows something, Adamic et al (2008)

Strongly connected components

Understanding biological control systems

- Bacillus subtilis spore formation control network.
- SCC constitutes a functional module.

Josh Hug: Qualifying exam talk (2008)

Strong components algorithms: brief history

1960s: Core OR problem.

- Widely studied; some practical algorithms.
- Complexity not understood.

1972: linear-time one-pass DFS algorithm (Tarjan).

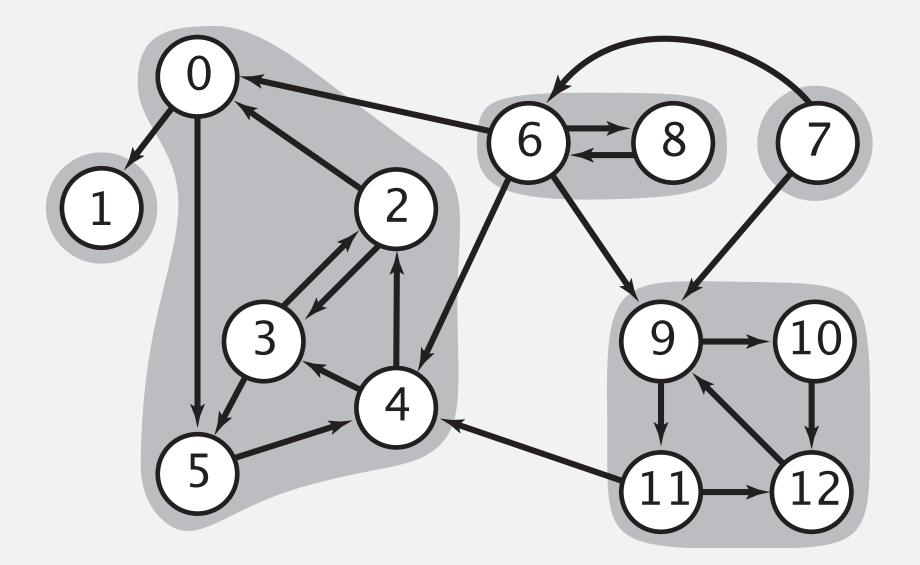

- Classic algorithm.
- Level of difficulty: Algs4++.
- Demonstrated broad applicability and importance of DFS.

1980s: easy two-pass linear-time algorithm (Kosaraju-Sharir).

- Forgot notes for lecture; developed algorithm in order to teach it!
- Later found in Russian scientific literature (1972).

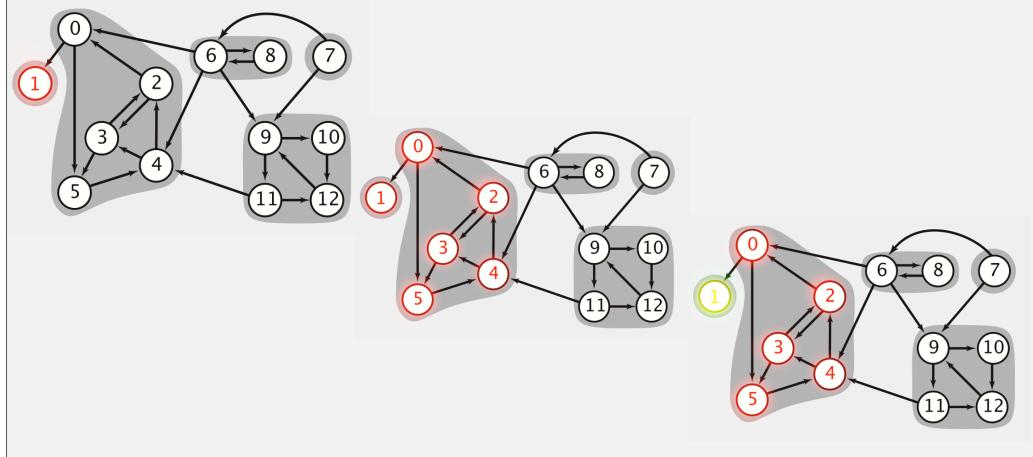

1990s: easier one-pass linear-time algorithms.

- Gabow: fixed old OR algorithm.
- Cheriyan-Mehlhorn: needed one-pass algorithm for LEDA.

Example

Run DFS(1), get the SCC: {1}. Run DFS(0), get {0, 1, 2, 3, 4, 5} - not an SCC. Run DFS(1), then DFS(0), get SCC {1} and SCC {0, 2, 3, 4, 5}.

Q:

Α.

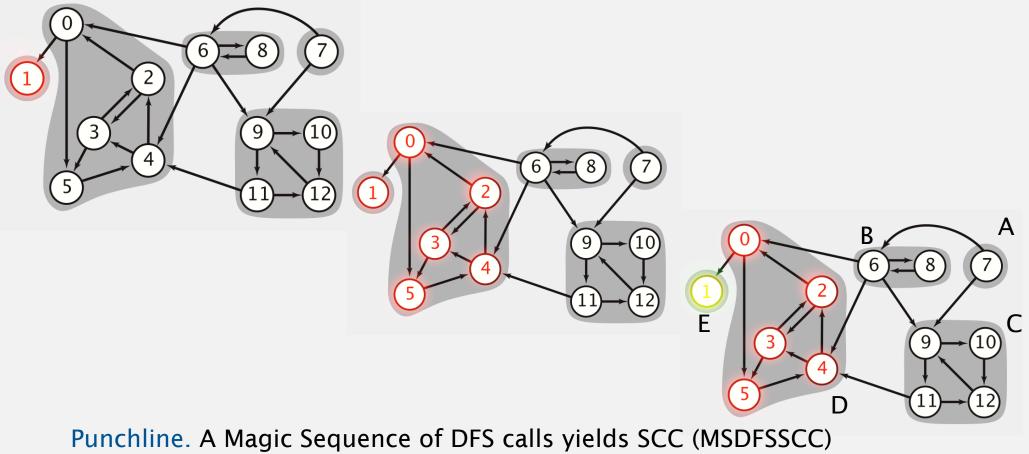

B

С

pollEv.com/jhug	Image: wide wide wide wide wide wide wide wide
: Which DFS call should come next?	
. DFS(7)	[496641]
. DFS(6) or DFS(8)	[497301]
. DFS(9), DFS(10), DFS(11), or DFS(12) [497302]

Example

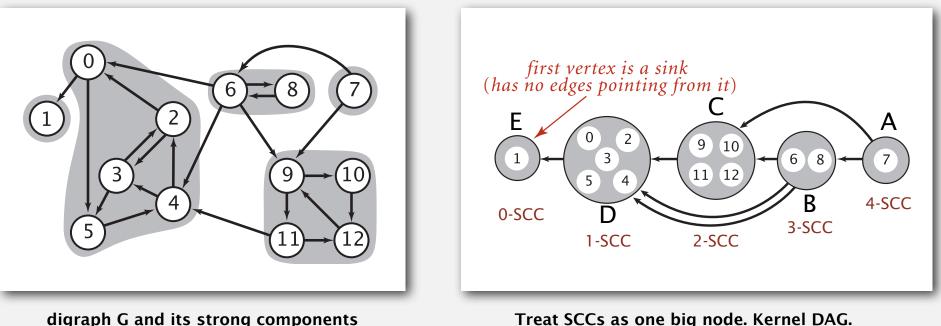

Run DFS(1), get the SCC: {1}. Run DFS(0), get {0, 1, 2, 3, 4, 5} - not an SCC. Run DFS(1), then DFS(0), get SCC {1} and SCC {0, 2, 3, 4, 5}.

DFS. Calling DFS wantonly is a problem. Never want to leave your SCC.

0-SCCs. There's always some set of SCCs with outdegree 0, e.g. {1}. Calling DFS on any node in a 0-SCCs finds only nodes in that 0-SCC.

Number is not the out degree. It's the hierarchy level! also known as: a sink 1-SCCs. After calling DFS on and identifying all 0-SCCs, if any vertices are unmarked, there's at least one SCC that only points at 0-SCCs.

digraph G and its strong components

Arrows only connect SCCs. Graph is acyclic.

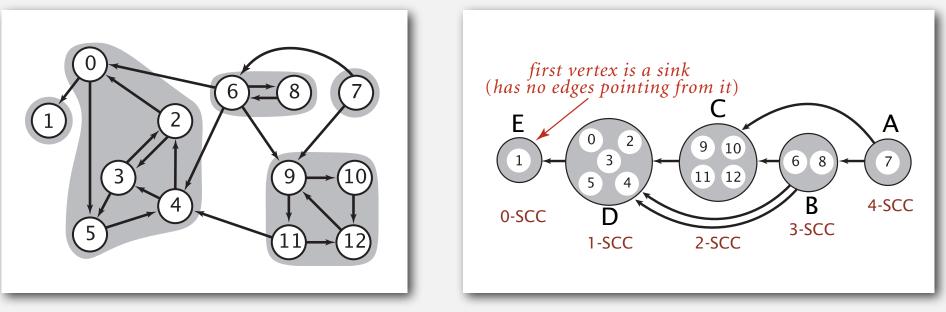

Kosaraju-Sharir algorithm: intuitive example

Kernel DAG. Topological sort of kernelDAG(G) is A, B, C, D, E.

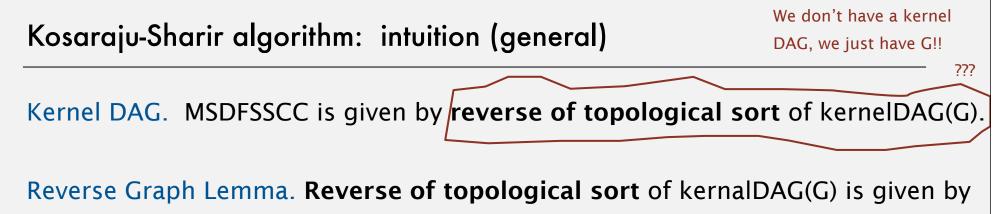

MSDFSSCC. Call DFS on element from E, D, C, B, A. Valid MSDFSSCC. For example, DFS(1), DFS(2), DFS(9), DFS(6), DFS(7).

Summary.

• An MSDFSSCC is given by reverse of the topological sort of kernelDAG(G).

digraph G and its strong components

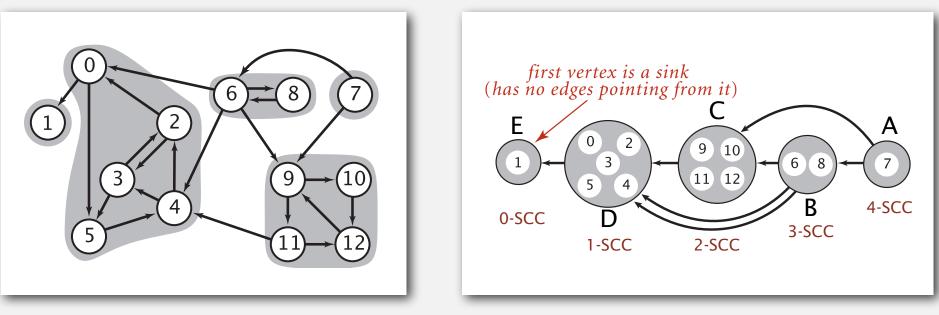

reverse postorder of G^R (see book), where G^R is G with all edges flipped around.

Slippery little lemma! You're not required to understand the proof.

Punchline.

• MSDFSSCC: The reverse postorder of *G*^{*R*}.

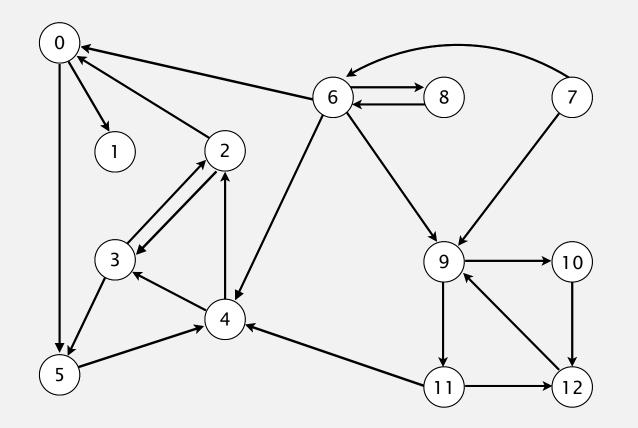

digraph G and its strong components

Kosaraju-Sharir algorithm demo

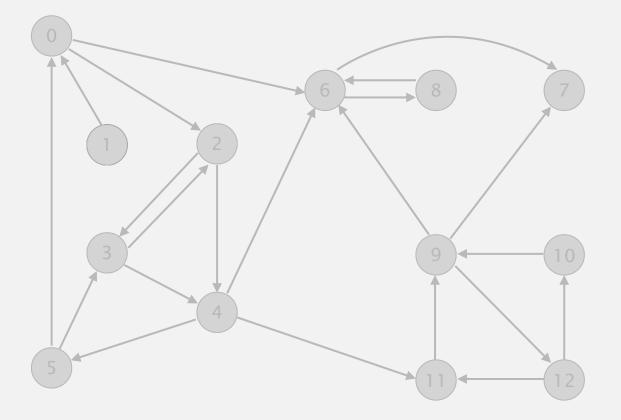

- Phase 1. Compute reverse postorder in G^R.
- Phase 2. Run DFS in G, visiting unmarked vertices in reverse postorder of G^R .

idarray

Kosaraju-Sharir algorithm

Proposition. Kosaraju-Sharir algorithm computes the strong components of a digraph in time proportional to E + V.

Pf.

- Running time: bottleneck is running DFS twice (and computing G^R).
- Correctness: tricky, see textbook (2nd printing).
- Implementation: easy!

Connected components in an undirected graph (with DFS)

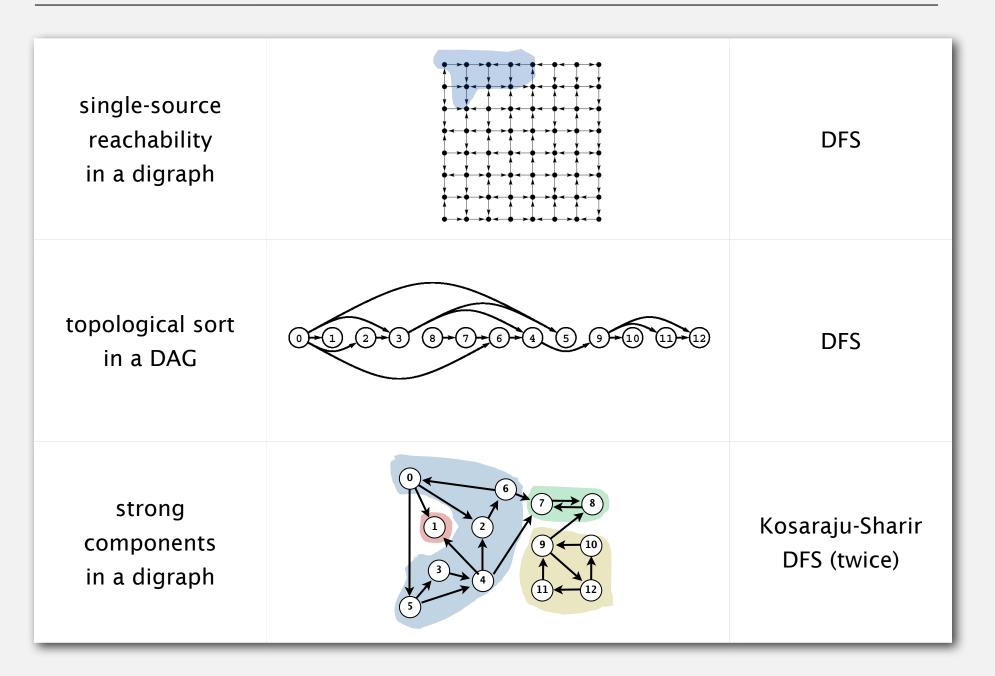

```
public class CC
   private boolean marked[];
   private int[] id;
   private int count;
   public CC(Graph G)
      marked = new boolean[G.V()];
      id = new int[G.V()];
      for (int v = 0; v < G.V(); v++)
      {
         if (!marked[v])
         {
            dfs(G, v);
            count++;
         }
      }
   }
   private void dfs(Graph G, int v)
   {
      marked[v] = true;
      id[v] = count;
      for (int w : G.adj(v))
         if (!marked[w])
            dfs(G, w);
   }
   public boolean connected(int v, int w)
   { return id[v] == id[w]; }
```

}

Strong components in a digraph (with two DFSs)

```
public class KosarajuSharirSCC
   private boolean marked[];
   private int[] id;
   private int count;
   public KosarajuSharirSCC(Digraph G)
