Written Exam 2 (Spring 2015)

There are 8 questions on this exam, weighted as indicated below. This exam is closed book. You may use a single-page two-sided hand-written cheatsheet. There is a blank page intended for scratch paper at the end of the exam. No calculators or other electronic devices are allowed. Give your answers and show your work in the space provided. You will have 50 minutes to complete this test.

Print your name, login, and precept information on this page (now). Write out and sign the Honor Code pledge. As you know, it is a violation of the Honor Code to discuss the contents of this exam **with anyone** until after the solutions have been posted.

1. Object Oriented Programming (10 points). Fill in the boxes below with the letter corresponding to the best description of that part of the program.

A. initialize object
 B. local variable
 C. instance method
 D. invoke method
 E. constructor
 H. class name
 I. test client

```
private double rx, ry; // position
   private double q; // charge
   public Charge(double x0, double y0, double q0) {
       rx = x0;
       ry = y0;
       q = q0;
   public double potentialAt(double x, double y) {
       double k = 8.99e09;
       double dx = x - rx;
       double dy = y - ry;
       return k * q / Math.sqrt(dx*dx + dy*dy);
   public String toString() {
       return q + " at " + "(" + rx + ",
   public static void main(String[] args) {
       double x = Double.parseDouble(args[0]);
       double y = Double.parseDouble(args[1]);
       Charge c1 = new Charge(.51, .63, 21.3);◀
       Charge c2 = new Charge(.13, .94, 81.9);◀
       System.out.println(c1);
       System.out.println(c2);
       double v1 = c1.fotentialAt(x, y);
       double v2 = c2.potentialAt(x, y);
       StdOut.println(v1+v2);
}
```

2. Abstract Data Types (5 points). Choose	e the best data type for the following situations.
A. ST <string[], string=""></string[],>	
B. ST <string, queue<string="">></string,>	
C. ST <integer, integer=""></integer,>	
D. Queue <string></string>	
<pre>E. ST<string, int[]="" st<string,=""></string,></pre>	
F. ST <integer, point=""></integer,>	
G. Stack <point></point>	
H. Queue <point></point>	
 For each precept of COS 126 (named Pothat each student (netID) gets for Assignment Keep track of all your U.S. friends by state 	ents 0 through 8.
3. For each day of a given month, record thave an exam on that day.	the number of COS 126 students who
4. Make a list of all the books you plan to there are at least 2 books.)	read this summer. (Assume that
5. In a graph of Points, after finding the sh to another Point finish, find the Point-by finish back to start.	<u>C</u>

4. Linked Lists (8 points). Consider the following code for a null-terminated linked list.

```
public class GuitarList {
   private Node start; // first node in the linked list

private class Node {
   private GuitarString value;
   private Node next;
}

public GuitarList() { start = null; }

// puts n at the end of the linked list
   public void insertAfterLast(Node n) {
      if (start == null) { // special case
            start = n; return;
      }
      // finish this method
   }
}
```

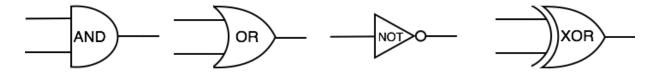

Which of the following would be a successful implementation of insertAfterLast()?

```
for (Node i = start; i.next != null; i = i.next);
Node i = start;
do {
                            i.next = n;
   i = i .next;
} while (i != null);
                                            ☐ YES ▼ NO
                                                              This code won't compile.
i.next = n;
                                                                  Do you see why?
           V NO
  YES
                                       Node i = start;
                                       boolean keepGoing = true;
                                       while (keepGoing) {
Node i = start;
                                           Node next = i.next;
Node j = start;
                                           if (next == null)
while (i != null) {
                                               keepGoing = false;
   j = i;
                                           else
   i = i.next;
                                               i = next;
j.next = n;
                                       i.next = n;
  YES
                                            YES
            □ NO
```

5. Theory (14 points). For each statement below, check all that apply.

	The Halting Problem	Factoring	Sorting	Boolean Satisfiability (SAT)	Travelling Salesperson Problem
1. These problems are decidable/computable.		√	V	V	V
2. As far as we know, only these problems are in P.			V		
3. As far as we know, these problems are in NP but not in P.		✓		V	V
4. These problems can be reduced to SAT.		~	V	√	V
5. As far as we know, these problems are not in P and not NPC.	√	\checkmark			
	Turing Machines	Regular Expressions	TOY with sufficient memory	DFA's	None of these
6. If the Church-Turing thesis holds, these models can perform any possible computation.	√		√		
7. These models cannot express some Java programs.		V		V	
8. These models cannot be simulated in Java.					✓
9. These models always halt on all finite inputs.		✓		V	
10. These models can always correctly check whether an arbitrary Java program halts on some finite input.					✓

6. Circuits (10 points). First, a reminder of the shape of the following logic gates:

In the left column below, there are circuits that use only **AND**, **OR**, and **NOT** gates. In the right column below, there are circuits that use only **XOR** gates.

Fill in the boxes on the left with the letter of the equivalent circuit on the right. If no circuit on the right matches, put the letter "F" in the box.

TOY REFERENCE CARD

INSTRUCTION FORMATS

ARITHMETIC and LOGICAL operations

1:	add	R[d]	<-	R[s]	+	R[t]
2:	subtract	R[d]	<-	R[s]	_	R[t]
3:	and	R[d]	<-	R[s]	&	R[t]
4:	xor	R[d]	<-	R[s]	^	R[t]
5:	shift left	R[d]	<-	R[s]	<<	R[t]
6:	shift right	R[d]	<-	R[s]	>>	R[t]

TRANSFER between registers and memory

7: load address R[d] <- addr 8: load R[d] <- mem[addr] 9: store mem[addr] <- R[d] A: load indirect R[d] <- mem[R[t]] B: store indirect mem[R[t]] <- R[d]

CONTROL

- Register 0 always reads 0.

 Loads from mem[FF] come from stdin.

 Stores to mem[FF] go to stdout.

 pc starts at 10

```
16-bit registers
16-bit memory locations
8-bit program counter
```

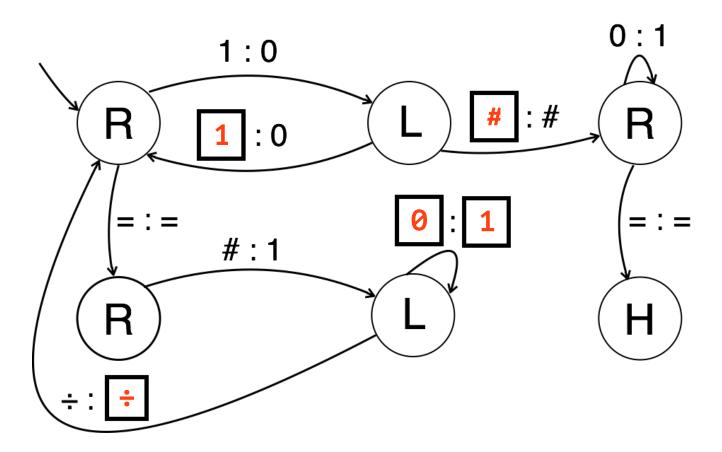

7. TOY architecture (8 points). Check all the boxes that correspond to the datapaths needed to fetch and execute the following TOY instructions.

8. Turing Machines (5 points). The Turing Machine below will perform integer division on unary numbers, discarding the remainder. As you will recall, unary numbers are represented by consecutive ones. For example $4 \div 2 = 2$, in unary, is expressed as follows: 1111 \div 11 = 11. Your task is to fill in the blank squares below so that this machine will work. As usual, we omit arrows that stay in the same state and don't change the symbol.

For example, if the tape is configured as follows, with the tape head on the ÷ symbol.

The final state of the tape should be:
