

**Q1:** Give the value and type of each of the following Java expressions. If an expression will not compile or will cause an exception at runtime, put an **X** under value and type. If the value is a string, enclose it in double quotes.

Expression	Value	Type
<code>1 / 0</code>	<b>X</b>	<b>X</b>
<code>"800" * 1</code>	<b>X</b>	<b>X</b>
<code>"1" + " - " + "1"</code>	<b>"1 - 1"</b>	<b>String</b>
<code>3.14159 + (int) Math.PI</code>	<b>6.14159</b>	<b>double</b>
<code>1-1-1-1</code>	<b>-2</b>	<b>int</b>
<code>3 / 2.0 + 2 * 5</code>	<b>11.5</b>	<b>double</b>
<code>(8 &lt;= 2)    (2e8 &lt;= 8e2)</code>	<b>false</b>	<b>boolean</b>
<code>Double.parseDouble("8.5*2")</code>	<b>X</b>	<b>X</b>
<code>"1" + 1 + 1 + "1"</code>	<b>"1111"</b>	<b>String</b>

**Q2:** Consider the following code:

```
public class MethodTester {
    private static void methodB(int[] c, int d) {
        c[0]++;
        d += 42;
    }
    private static int methodA(int[] a, int b) {
        methodB(a, b);
        a[0]++;
        return b/2;
    }
    public static void main(String[] args) {
        int[] arr = {8, 9, 10};
        int x = 1;
        x = methodA(arr, x);
        System.out.println(arr[0] + " " + x);
    }
}
```

Which one of the following is the output of this program?

"8 3"

"8 10"

"8 21"

"9 1"

"9 3"

"9 21"

**"10 0"**

"10 1"

"10 21"

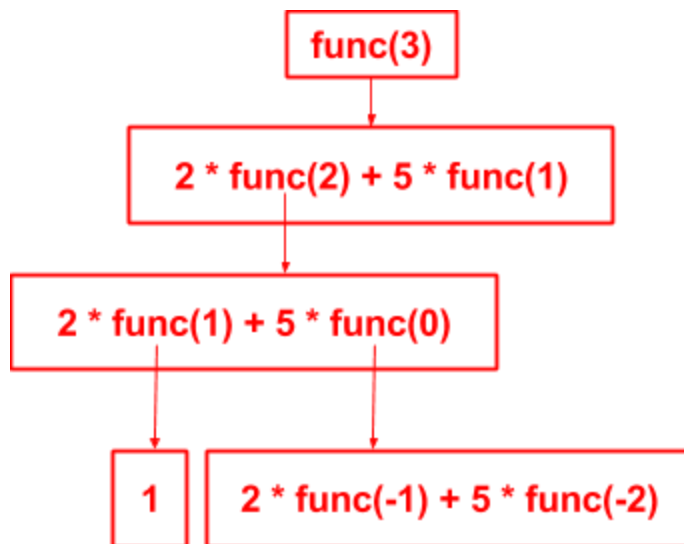

**Q3:** Consider the following code:

```
public class Series {
    public static int func(int j) {
        if (j==1) return 1;
        return 2 * func(j - 1) + 5 * func(j - 2);
    }

    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]); // assume N >= 0

        System.out.println(func(N));
    }
}
```

a. Draw the recursion tree for `func(3)`. You only need to draw the tree up to 3 levels.

b. What is the problem with this recursive program, based on the tree you drew above?

**The problem is the the function reductive step skips over the base case which will result in a stack overflow error.**

**Change `if (j == 1) return 1;` to `if (j <= 1) return 1;`**

**Q4:** Fill in the blanks in the following table.

hex	decimal	16-bit two's complement	TOY instruction pseudo-code
FFFE	-2	1111111111111110	R[F] = PC; PC = FE
1234	4,660	<b>0001001000110100</b>	R[2] = R[3] + R[4]
1101	4,353	0001000100000001	<b>R[1] = R[0] + R[1]</b>
77FF	30,719	0111011111111111	R[7] = 00FF
FF01	<b>-255</b>	<b>1111111100000001</b>	<b>R[F] = PC; PC = 01</b>
7A00	<b>31232</b>	0111101000000000	<b>R[A] = 0000</b>

**Hint:**  $7 \cdot 16^3 = 28,672$ .

**Q5:** Consider the following TOY program:

```
20: 81FF R[1] = stdin
21:      SEE BELOW
22: 1211 R[2] = R[1] + R[1]
23: 0000 halt
```

What is the value of R[1] after executing the code above, where M[21] is replaced by one of the following instructions. Note, the PC starts on line 20 and 1111 is on standard input.

Your answers must be four hex digits.

<b>M[21] set to</b>	<b>Value of R[1] after halt</b>
21: 1111 R[1] = R[1] + R[1]	<b>2222</b>
21: 0000 halt	<b>1111</b>
21: 1211 R[2] = R[1] + R[1]	<b>1111</b>
21: 7100 R[1] = 0000	<b>0000</b>
21: C023 PC = 23	<b>1111</b>
21: 8121 R[1] = M[21]	<b>8121</b>
21: 9122 M[22] = R[1]	<b>2222</b>
