

Module Design Principles

We propose 7 module design principles

Modularity design principles

- List, string, stdio, SymTable

1

Stack Module

List module (wrong)

```
list.h
struct List {int len; int *data};
struct List * new(void);
void insert (struct List *P,
            int key);
void concat (struct List *P,
             struct List *Q);
int nth_key (struct List *P,
             int n);
void free (List *P);
```

3

Stdio Module

List module (abstract)

```
list.h
struct List;
struct List * new(void);
void insert (struct List *P,
            int key);
void concat (struct List *P,
             struct List *Q);
int nth_key (struct List *P,
             int n);
void free (List *P);
```

Stdio Module

stdio (cont.)

```
...
FILE * fopen(const char *filename, const char *mode);
int fclose(FILE *f);
int fflush(FILE *f);
int fgetc(FILE *f);
getchar(void);
int fputc(int c, FILE *f);
putchar(int c);
int fscanf(FILE *f, const char *format, ...);
int scanf(const char *format, ...);
int fprintf(FILE *f, const char *format, ...);
int printf(const char *format, ...);
int sscanf(const char *str, const char *format, ...);
int sprintf(char *str, const char *format, ...);
int vsprintf(char *str, const char *format, ...);
...
```

5

String Module

string module (from C90)

```
/* string.h */
size_t strlen(const char *s);
char *strcpy(char *dest, const char *src);
char *strncpy(char *dest, const char *src, size_t n);
char *strcat(char *dest, const char *src);
char *strncat(char *dest, const char *src, size_t n);
int strcmp(const char *s1, const char *s2);
int strncmp(const char *s1, const char *s2, size_t n);
char *strncpy(const char *haystack, const char *needle);
void *memcopy(void *dest, const void *src, size_t n);
int memcmp(const void *s1, const void *s2, size_t n);
...
```

4

Stdio Module

stdio module (from C90, vastly simplified)

```
...
/* stdio.h */
struct FILE
{
    int cnt; /* characters left */
    char *ptr; /* next character position */
    char *base; /* location of buffer */
    int flag; /* mode of file access */
    int fd; /* file descriptor */
};

#define OPEN_MAX 1024
FILE _iob[OPEN_MAX];
#define stdin (&_iob[0]);
#define stdout (&_iob[1]);
#define stderr (&_iob[2]);
...
```

Don't be concerned
with details

6

SymTable Module

SymTable module (from Assignment 3)

```
/* symtable.h */
typedef struct SymTable *SymTable_T;
SymTable_T SymTable_new(void);
SymTable_free(SymTable_T t);
void SymTable_getLength(SymTable_T t, const char *key,
    int size_t *const void *value);
void SymTable_replace(SymTable_T t, const char *key,
    const void *value);
void SymTable_contains(SymTable_T t, const char *key);
int SymTable_get(SymTable_T t, const char *key);
void SymTable_remove(SymTable_T t, const char *key);
void SymTable_map(SymTable_T t,
    void (*prappy)(const char *key,
        void *value, void *extra),
    const void *extra);
```

7

- A good module:
 - **Encapsulates data**
 - Is consistent
 - Has a minimal interface
 - Detects and handles/reports errors
 - Establishes contracts
 - Has strong cohesion (if time)
 - Has weak coupling (if time)

8

Agenda

- A well-designed module encapsulates data
 - An interface should hide implementation details
 - A module should use its functions to encapsulate its data
 - A module should not allow clients to manipulate the data directly
- Why?
 - Clarity: Encourages abstraction
 - Security: Clients cannot corrupt object by changing its data in unintended ways
 - Flexibility: Allows implementation to change – even the data structure – without affecting clients

9

Encapsulation

Encapsulation Example 1

```
List (nonabstract)
list.h
struct List {
    struct List * new(void);
    struct List * new(int len, int *data);
    void insert (struct List *p,
        int key);
    void concat (struct List *p,
        struct List *q);
    int nth_key (struct List *p,
        int n);
    void free_list (List *p);
};
```

- Interface reveals how List object is implemented
 - That is, as an array
 - Client can access/change data directly; could corrupt object

10

Encapsulation Example 1

```
List (abstract, with typedef)
list.h
typedef struct List *List_T;
List_T new(void);
List_T new(void);
void insert (List_T p, int key);
void concat (List_T p, List_T q);
int nth_key (List_T p, int n);
void free_list (List_T p);
```

Place declaration of
struct Stack in interface;
move **definition** to
implementation

Encapsulation Example 1

```
list.h
List (abstract)
typedef struct List *List_T;
List_T new(void);
List_T new(void);
void insert (List_T p, int key);
void concat (List_T p, List_T q);
int nth_key (List_T p, int n);
void free_list (List_T p);
```

Opaque pointer
type

- Interface provides **List_T** abbreviation for client
 - Interface encourages client to think of **objects** (not structures) and **object references** (not pointers to structures)
 - Client still cannot access data directly
 - That's better still

11

12

Encapsulation Examples 2, 4

Encapsulation Example 3

- string
 - Doesn't encapsulate the string data: user can access the representation directly.
 - This is *not* an ADT, it is just a (nonabstract) "data type."

SymTable

- Uses the opaque pointer-to-type pattern
- Encapsulates state properly

13

```
stdio /* stdio.h */  
struct FILE  
{  
    int ent; /* characters left */  
    char *ptr; /* next character position */  
    char *base; /* location of buffer */  
    int flag; /* mode of file access */  
    int fd; /* file descriptor */  
};  
...
```

- Violates the abstraction principle
- Programmers can access data directly
 - Can corrupt the FILE object
 - Can write non-portable code
- But the functions are well documented, so
 - Few programmers examine stdio.h
 - Few programmers are boneheaded enough to access the data directly

14

15

Encapsulation Example 3

```
stdio /* stdio.h */  
struct FILE  
{  
    int ent; /* characters left */  
    char *ptr; /* next character position */  
    char *base; /* location of buffer */  
    int flag; /* mode of file access */  
    int fd; /* file descriptor */  
};  
...
```

- Why did its designers violate the abstraction principle?

Two reasons:

1. In 1974 when stdio.h was first written, the abstraction principle was not widely understood (Barbara Liskov at MIT was just then inventing it)
2. Because function calls were expensive, getchar() and getc() were implemented as macros that accessed the FILE struct directly. But in the 21st century, function calls are not expensive anymore: getchar() isn't a macro anymore in most implementations of stdio.h.

15

When's the right time . . .

to make an opaque structure definition in stdio.h?

```
/* stdio.h */  
struct FILE;  
...
```

Well, suppose there are 100 million C modules that import stdio.h.
Let's suppose 99% use FILE as if it were opaque, and would not be broken by changing to an opaque structure definition.

In which year is it OK to break 1 million C modules?

Summary: stdio.h is "practically" an ADT, and you should treat it as if "struct FILE" were opaque.

16

Agenda

A good module:

- Encapsulates data
- **Is consistent**
- Has a minimal interface
- Detects and handles/reports errors
- Establishes contracts
- Has strong cohesion (if time)
- Has weak coupling (if time)

Consistency

A well-designed module is consistent

- A function's name should indicate its module
 - Facilitates maintenance programming
 - Programmer can find functions more quickly
 - Reduces likelihood of name collisions
 - From different programmers, different software vendors, etc.
- Facilities writing client code

17

18

Consistency Examples 1

Consistency Examples 1, 4

Consistency Example 2

- List**
- (-) Each function name begins with "List_"
 - (+) First parameter identifies List object

Ops, let's fix that!

```
typedef struct List *list_T;
list_T list_new(void);
void list_insert(list_T p, int key);
void list_concat(list_T p, list_T q);
int list_nth_key(list_T p, int n);
void list_free(list_T p);
```

- List (revised)**
- (+) Each function name begins with "List_"
 - (+) First parameter identifies List object

19

string

```
/* string.h */
size_t strlen(const char *s);
char *strcpy(char *dest, const char *src);
char *strncpy(char *dest, const char *src, size_t n);
char *strcat(char *dest, const char *src);
char *strncat(char *dest, const char *src, size_t n);
int strcmp(const char *s1, const char *s2, size_t n);
int strncmp(const char *s1, const char *s2, size_t n);
char *strrchr(const char *haystack, const char *needle);
void *memcpy(void *dest, const void *src, size_t n);
int memcmp(const void *s1, const void *s2, size_t n);
...
```

- Are function names consistent?
- Is parameter order consistent?

21

Consistency Example 3

Minimization

Agenda

A good module:

- Encapsulates data
- Is consistent
- **Has a minimal interface**
- Detects and handles/reports errors
- Establishes contracts
- Has strong cohesion (if time)
- Has weak coupling (if time)

- A well-designed module has a minimal interface**
- Function declaration should be in a module's interface if and only if:
 - The function is **necessary** to make objects complete, or
 - The function is **convenient** for many clients

Why?

- More functions ⇒ higher learning costs, higher maintenance costs

22

24

Minimization Example 2

string

```
/* string.h */
size_t strlen(const char *s);
char *strcpy(char *dest, const char *src);
char *strncpy(char *dest, const char *src, size_t n);
char *strcat(char *dest, const char *src, size_t n);
char *strncat(char *dest, const char *src, size_t n);
int strcmp(const char *s1, const char *s2);
int strncmp(const char *s1, const char *s2, size_t n);
char *strrchr(const char *haystack, const char *needle);
void *memmove(void *dest, const void *src, size_t n);
int memcmp(const void *s1, const void *s2, size_t n);
...
...
```

stdio

```
FILE *fopen(const char *filename, const char *mode);
int fclose(FILE *f);
int fgetc(FILE *f);
int getchar(void);
int fputc(int c, FILE *f);
int putchar(int c);
int fscanf(FILE *f, const char *format, ...);
int scanf(const char *format, ...);
int fprintf(FILE *f, const char *format, ...);
int printf(const char *format, ...);
int sscanf(const char *str, const char *format, ...);
int sprintf(char *str, const char *format, ...);
...
...
```

Should any functions be eliminated?

25

Minimization Example 3

stdio

```
FILE *fopen(const char *filename, const char *mode);
int fclose(FILE *f);
int fgetc(FILE *f);
int getchar(void);
int fputc(int c, FILE *f);
int putchar(int c);
int fscanf(FILE *f, const char *format, ...);
int scanf(const char *format, ...);
int fprintf(FILE *f, const char *format, ...);
int printf(const char *format, ...);
int sscanf(const char *str, const char *format, ...);
int sprintf(char *str, const char *format, ...);
...
...
```

Should any functions be eliminated?

26

Minimization Example 4

SymTable

```
...  
• Declares SymTable_get() in interface  
• Declares SymTable_contains() in interface  
  
Should SymTable_contains()  
be eliminated?  
  
Should  
SymTable_contains()  
be eliminated?  
...
```

27

Minimization Example 4

SymTable

A well-designed module detects and handles/reports errors

A good module:

- Encapsulates data
- Is consistent
- Has a minimal interface
- **Detects and handles/reports errors**
- Establishes contracts
- Has strong cohesion (if time)
- Has weak coupling (if time)

Should SymTable_hash()
be declared in interface?

Incidentally: In C any function should be either:

- Declared in the interface and defined as non-static, or
- Not declared in the interface and defined as static

- A module often cannot assume what error-handling action its clients prefer

28

29

30

Handling Errors in C

C options for detecting errors

- if statement
- assert macro

C options for handling errors

- Write message to stderr
 - Impossible in many embedded applications
 - Recover and proceed
 - Sometimes impossible
 - Abort process
 - Often undesirable

31

Reporting Errors in C

C options for reporting errors to client (calling function)

- Set global variable?

```
int dividend, int divisor, int *quotient
{
    if (divisor == 0)
        return 0;
    ...
    *quotient = dividend / divisor;
}
...
successful = div(5, 3, &quo);
if (!successful)
    /* Handle the error */
```

- Easy for client to forget to check
 - Bad for multi-threaded programming

32

Reporting Errors in C

C options for reporting errors to client (calling function)

- Use function return value?

```
int dividend, int divisor, int *quotient
{
    if (divisor == 0)
        return 0;
    ...
    *quotient = dividend / divisor;
}
...
successful = div(5, 3, &quo);
if (!successful)
    /* Handle the error */
```

- Awkward if return value has some other natural purpose

33

Reporting Errors in C

C options for reporting errors to client (calling function)

- Use call-by-reference parameter?

```
int dividend, int divisor, int *successful
{
    if (divisor == 0)
        *successful = 0;
    return 0;
}
*successful = 1;
return dividend / divisor;
...
quo = div(5, 3, &successful);
if (!successful)
    /* Handle the error */
```

- Awkward for client; must pass additional argument
 - Error terminates the process!

34

Reporting Errors in C

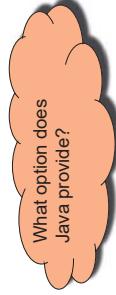

C options for reporting errors to client (calling function)

- No option is ideal

```
int dividend, int divisor
{
    assert(divisor != 0);
    return dividend / divisor;
}
...
quo = div(5, 3);
```

- Asserts could be disabled
 - Error terminates the process!

35

36

User Errors

Our recommendation: Distinguish between...

(1) User errors

- Errors made by human user
- Errors that "could happen"
- Example: Bad data in `stdin`
- Example: Too much data in `stdin`
- Example: Bad value of command-line argument
- Use `if` statement to detect
 - Handle immediately if possible, or...
 - Report to client via return value or call-by-reference parameter
 - Don't use global variable
- Use `assert`
- Example: Write to file fails because disk is full
 - Example: Divisor argument to `div()` is 0

37

Programmer Errors

(2) Programmer errors

- Errors made by a programmer
- Errors that "should never happen"
- Example: pointer parameter should not be `NULL`, but is
 - For now, use `assert` to detect and handle
 - More info later in the course
- The distinction sometimes is unclear
 - Example: Write to file fails because disk is full
 - Example: Divisor argument to `div()` is 0
- Default: user error
- Use `assert`
- Example: `strlent()` parameter is `NULL` ⇒ seg fault (if you're lucky)

38

Error Handling Example 1

List

```
typedef struct List *list_T;  
list_T list_new(void);  
void list_insert(list_T p, int key);  
void list_concat(list_T p, list_T q);  
int list_nth_key(list_T p, int n);  
void list_free(list_T p);  
  
add assert(p) in each of the functions... try to protect against bad clients
```

39

Error Handling Examples 2, 3, 4

SymTable

- See assignment specification for proper errors that should be detected, and how to handle them
- This error-handling in `list_nth_key` is a bit lame.
- How to fix it? Some choices:
 - `int List_nth_key(List_T p, int n, int *error);`
 - Or, perhaps better: add an interface function,
`int List_length(List_T p);` and then,
Operation `nth_key(p, n)`, if `p` represents $\sigma_1 \cdot \sigma_2$, where the length of σ_1 is n , returns i ; otherwise (if the length of the string represented by `p` is $\leq n$), it returns an arbitrary integer.

41

Error Handling Example 2

Agenda

```
typedef struct List *list_T;  
list_T list_new(void);  
void list_insert(list_T p, int key);  
void list_concat(list_T p, list_T q);  
int list_nth_key(list_T p, int n);  
void list_free(list_T p);  
  
void List_insert(list_T p, int key) {  
    assert(p);  
    assert(p->key);  
    assert(p->next);  
    ...  
}
```

39

Error Handling Example 3

String

```
string strlent();  
• No error detection or handling/reporting  
• Example: strlent() parameter is NULL ⇒ seg fault (if you're lucky)
```

- A good module:
 - Encapsulates data
 - Is consistent
 - Has a minimal interface
 - Detects and handles/reports errors
 - Establishes contracts
 - Has strong cohesion (if time)
 - Has weak coupling (if time)
- Detects bad input
 - Uses function return values to report failure
 - Note awkwardness of `scanf()`
 - Sets global variable `errno` to indicate reason for failure

42

Establishing Contracts

- A well-designed module establishes contracts
 - A module should establish contracts with its clients
 - Contracts should describe what each function does, esp:
 - Meanings of parameters
 - Work performed
 - Meaning of return value
 - Side effects

Why?

- Facilitates cooperation between multiple programmers
- Assigns blame to contract violators!!!
 - If your functions have precise contracts and implement them correctly, then the bug must be in someone else's code!!!

How?

- Comments in module interface

43

Contracts Example 1

List

```
/* list.h */  
/* Return the n'th element of the list p,  
if it exists. Otherwise (if n is  
negative or >= the length of the list),  
abort the program. */  
int List_nth_key (List_T p, int n);
```

Comment defines contract:

- Meaning of function's parameters
 - p is the list to be operated on; n is the index of an element
 - Obligations of caller
 - (implicit) make sure p is a valid list
 - make sure n is in range; (implicit) make sure p is a valid list
 - make sure n is in range;
 - Return the n'th element.
 - Meaning of return value
 - Side effects
 - (None, by default)

44

45

Contracts Example 1b

List

```
/* list.h */  
/* If 0 <= n < length(p), return the n'th element of  
the list p and set success to 1. Otherwise (if n is  
out of range) return 0 and set success to 0. */  
int List_nth_key (List_T p, int n, int *success);
```

Comment defines contract:

- Meaning of function's parameters
 - p is the list to be queried; n is the index of an element; success is an error flag
 - Obligations of caller
 - (implicit) make sure p is a valid List
 - Work performed
 - Return the nth element; set success appropriately
 - Meaning of return value
 - Side effects
 - Set success

45

Strong Cohesion

Agenda

- A well-designed module has **strong cohesion**
 - A module's functions should be strongly related to each other

- Why?
 - Strong cohesion facilitates abstraction

- Strong coupling (if time)
 - Has weak coupling (if time)

46

Contracts Examples 2, 3, 4

- string
 - See descriptions in man pages
- stdio
 - See descriptions in man pages
- SymTable
 - See descriptions in assignment specification
 - Has strong cohesion (if time)
 - Has weak coupling (if time)

47

48

Strong Cohesion Examples

List

- (+) All functions are related to the encapsulated data
- string**
 - (+) Most functions are related to string handling
 - (-) Some functions are not related to string handling:
`memcopy()`, `memcmp()`, ...
- SymTable**
 - (+) But those functions are similar to string-handling functions
 - (+) Most functions are related to I/O
 - (-) Some functions don't do I/O: `scanf()`, `sscanf()`
 - (+) But those functions are similar to I/O functions

49

Agenda

A good module:

- Encapsulates data
- Is consistent
- Has a minimal interface
- Detects and handles/reports errors
- Establishes contracts
- Has strong cohesion (if time)
- **Has weak coupling (if time)**

- (+) All functions are related to the encapsulated data

50

Weak Coupling

A well-designed module has **weak coupling**

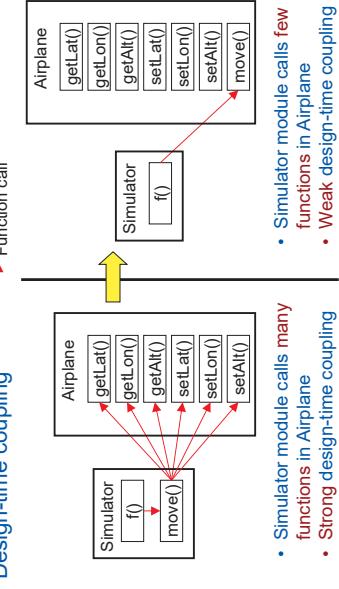

- Module should be weakly connected to other modules in program
- Interaction **within** modules should be more intense than interaction **among** modules
- Why? Theoretical observations**
 - Maintenance: Weak coupling makes program easier to modify
 - Reuse: Weak coupling facilitates reuse of modules
- Why? Empirical evidence**
 - Empirically, modules that are weakly coupled have fewer bugs

Examples (different from previous) ...

51

Weak Coupling Example 1

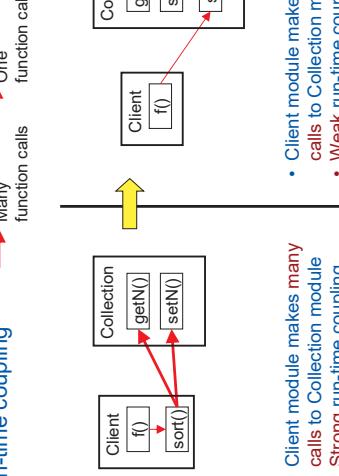

Design-time coupling

52

Weak Coupling Example 2

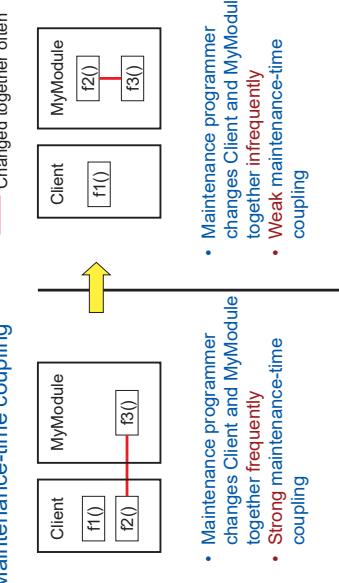

Run-time coupling

53

Weak Coupling Example 3

Maintenance-time coupling

54

Achieving Weak Coupling

Achieving weak coupling could involve refactoring code:

- Move code from client to module (shown)
- Move code from module to client (not shown)
- Move code from client and module to a new module (not shown)

.55

Summary

A good module:

- Encapsulates data
- Is consistent
- Has a minimal interface
- Detects and handles/reports errors
- Establishes contracts
- Has strong cohesion
- Has weak coupling

.56
