Some Innocuous Code

3

```
(* sum of 0..n *)  
  
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else 0  
;;  
  
let big_int = 1000000;;  
  
sum big_int;;
```

Let's try it.

(Go to tail.ml)

Some Other Code

4

Four functions: Green works on big inputs; Red doesn't.

```
let sum_to2 (n: int) : int =  
  let rec aux (n:int) (a:int) : int =  
    if n > 0 then  
      aux (n-1) (a+n)  
    else a  
  in  
  aux n 0  
;;
```

```
let rec sum2 (l:int list) : int =  
  match l with  
  [] -> 0  
  | hd::tail -> hd + sum2 tail  
;;
```

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else 0  
;;
```

```
let sum (l:int list) : int =  
  let rec aux (l:int list) (a:int) : int =  
    match l with  
    [] -> a  
    | hd::tail -> aux tail (a+hd)  
  in  
  aux l 0  
;;
```

Some Other Code

5

Four functions: Green works on big inputs; Red doesn't.

```
let sum_to2 (n: int) : int =  
  let rec aux (n:int) (a:int) : int =  
    if n > 0 then  
      aux (n-1) (a+n)  
    else a  
  in  
  aux n 0  
;;
```

```
let rec sum2 (l:int list) : int =  
  match l with  
  [] -> 0  
  | hd::tail -> hd + sum2 tail  
;;
```

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else 0  
;;
```

```
let sum (l:int list) : int =  
  let rec aux (l:int list) (a:int) : int =  
    match l with  
    [] -> a  
    | hd::tail -> aux tail (a+hd)  
  in  
  aux l 0  
;;
```

code that works:

*no computation after
recursive function call*

Tail Recursion

6

A *tail-recursive function* does no work after it calls itself recursively.

Not tail-recursive, the substitution model:

```
sum_to 1000000
```

```
(* sum of 0..n *)  
  
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else 0  
;;  
  
let big_int = 1000000;;  
  
sum big_int;;
```

Tail Recursion

7

A *tail-recursive function* does no work after it calls itself recursively.

Not tail-recursive, the substitution model:

```
sum_to 1000000
-->
1000000 + sum_to 99999
```

```
(* sum of 0..n *)

let rec sum_to (n:int) : int =
  if n > 0 then
    n + sum_to (n-1)
  else 0
;;

let big_int = 1000000;;

sum big_int;;
```

Tail Recursion

8

A *tail-recursive function* does no work after it calls itself recursively.

Not tail-recursive, the substitution model:

```
sum_to 1000000
-->
1000000 + sum_to 99999
-->
1000000 + 99999 + sum_to 99998
```

```
(* sum of 0..n *)

let rec sum_to (n:int) : int =
  if n > 0 then
    n + sum_to (n-1)
  else 0
;;

let big_int = 1000000;;

sum big_int;;
```

expression size grows
at every recursive call ...

lots of adding to do after
the call returns"

Tail Recursion

9

A *tail-recursive function* does no work after it calls itself recursively.

Not tail-recursive, the substitution model:

```
sum_to 1000000
-->
1000000 + sum_to 99999
-->
1000000 + 99999 + sum_to 99998
-->
...
-->
1000000 + 99999 + 99998 + ... + sum_to 0
```

```
(* sum of 0..n *)

let rec sum_to (n:int) : int =
  if n > 0 then
    n + sum_to (n-1)
  else 0
;;

let big_int = 1000000;;

sum big_int;;
```

Tail Recursion

10

A *tail-recursive function* does no work after it calls itself recursively.

Not tail-recursive, the substitution model:

```
sum_to 1000000
-->
1000000 + sum_to 99999
-->
1000000 + 99999 + sum_to 99998
-->
...
-->
1000000 + 99999 + 99998 + ... + sum_to 0
-->
1000000 + 99999 + 99998 + ... + 0
```

```
(* sum of 0..n *)

let rec sum_to (n:int) : int =
  if n > 0 then
    n + sum_to (n-1)
  else 0
;;

let big_int = 1000000;;

sum big_int;;
```

recursion
finally bottoms out

Tail Recursion

11

A *tail-recursive function* does no work after it calls itself recursively.

Not tail-recursive, the substitution model:

```
sum_to 1000000
-->
1000000 + sum_to 99999
-->
1000000 + 99999 + sum_to 99998
-->
...
-->
1000000 + 99999 + 99998 + ... + sum_to 0
-->
1000000 + 99999 + 99998 + ... + 0
-->
... add it all back up ...
```

```
(* sum of 0..n *)

let rec sum_to (n:int) : int =
  if n > 0 then
    n + sum_to (n-1)
  else 0
;;

let big_int = 1000000;;

sum big_int;;
```

do a long series
of additions to get
back an int

Non-tail recursive

12

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 10000
```

stack

sum_to 10000

Non-tail recursive

13

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 10000
```

Non-tail recursive

14

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 10000
```

Non-tail recursive

15

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 10000
```

Non-tail recursive

16

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 10000
```

Non-tail recursive

17

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 10000
```

Non-tail recursive

18

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 10000
```

Non-tail recursive

19

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 100
```

Data Needed on Return Saved on Stack

20

```
sum_to 10000
-->
...
--> 10000 + 9999 + 9998 + 9997 + ... +
-->
...
-->
...
```

not much space left!
will run out soon!

the stack

every non-tail call puts the data from the calling context on the stack

Memory is partitioned: Stack and Heap

21

heap space (big!)

stack space
(small!)

Tail Recursion

22

A *tail-recursive function* is a function that does no work after it calls itself recursively.

Tail-recursive:

```
sum_to2 1000000
```

```
(* sum of 0..n *)  
  
let sum_to2 (n: int) : int =  
  let rec aux (n:int) (a:int)  
    : int =  
    if n > 0 then  
      aux (n-1) (a+n)  
    else a  
  in  
    aux n 0  
;;
```

Tail Recursion

23

A *tail-recursive function* is a function that does no work after it calls itself recursively.

Tail-recursive:

```
sum_to2 1000000
-->
aux 1000000 0
```

```
(* sum of 0..n *)

let sum_to2 (n: int) : int =
  let rec aux (n:int)(a:int)
    : int =
    if n > 0 then
      aux (n-1) (a+n)
    else a
  in
  aux n 0
;;
```

Tail Recursion

24

A *tail-recursive function* is a function that does no work after it calls itself recursively.

Tail-recursive:

```
sum_to2 1000000
-->
aux 1000000 0
-->
aux 99999 1000000
```

```
(* sum of 0..n *)

let sum_to2 (n: int) : int =
  let rec aux (n:int)(a:int)
    : int =
    if n > 0 then
      aux (n-1) (a+n)
    else a
  in
  aux n 0
;;
```

Tail Recursion

25

A *tail-recursive function* is a function that does no work after it calls itself recursively.

Tail-recursive:

```
sum_to2 1000000
-->
aux 1000000 0
-->
aux 99999 1000000
-->
aux 99998 1999999
```

```
(* sum of 0..n *)

let sum_to2 (n: int) : int =
  let rec aux (n:int)(a:int)
    : int =
    if n > 0 then
      aux (n-1) (a+n)
    else a
  in
  aux n 0
;;
```

Tail Recursion

26

A *tail-recursive function* is a function that does no work after it calls itself recursively.

Tail-recursive:

```
sum_to2 1000000
-->
aux 1000000 0
-->
aux 99999 1000000
-->
aux 99998 1999999
-->
...
-->
aux 0 (-363189984)
-->
-363189984
```

(addition overflow occurred
at some point)

```
(* sum of 0..n *)

let sum_to2 (n: int) : int =
  let rec aux (n:int) (a:int)
    : int =
    if n > 0 then
      aux (n-1) (a+n)
    else a
  in
  aux n 0
;;
```

constant size expression

      aux (n-1) (a+n)  
    else a  
  in  
    aux n 0  
;;
```

stack

aux 0 BigNum

Question

32

We used human ingenuity to do the tail-call transform.

Is there a mechanical procedure to transform *any* recursive function in to a tail-recursive one?

not only is sum2
tail-recursive
but it reimplements
an algorithm that
took *linear space*
(on the stack)
using an algorithm
that executes in
constant space!

```
let rec sum_to (n: int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;
```

```
let sum_to2 (n: int) : int =  
  let rec aux (n:int) (a:int) : int =  
    if n > 0 then  
      aux (n-1) (a+n)  
    else a  
  in  
    aux n 0  
;;
```

human
ingenuity

CONTINUATION-PASSING STYLE

CPS!

CPS:

- Short for *Continuation-Passing Style*
- Every function takes a *continuation* (a function) as an argument that expresses "what to do next"
- CPS functions only call other functions as the last thing they do
- All CPS functions are tail-recursive

Goal:

- Find a mechanical way to translate any function in to CPS

Serial Killer or PL Researcher?

35

Serial Killer or PL Researcher?

36

Gordon Plotkin
Programming languages researcher
Invented CPS conversion.

Call-by-Name, Call-by Value
and the Lambda Calculus. TCS, 1975.

Robert Garrow
Serial Killer

Killed a teenager at a campsite
in the Adirondacks in 1974.
Confessed to 3 other killings.

Question

38

Can any non-tail-recursive function be transformed in to a tail-recursive one? Yes, if we can capture the *differential* between a tail-recursive function and a non-tail-recursive one.

```
let rec sum (l:int list) : int =  
  match l with  
  [] -> 0  
  | hd::tail -> hd + sum tail  
;;
```

Idea: Focus on what happens after the recursive call.

Question

39

Can any non-tail-recursive function be transformed in to a tail-recursive one? Yes, if we can capture the *differential* between a tail-recursive function and a non-tail-recursive one.

```
let rec sum (l:int list) : int =  
  match l with  
  [] -> 0  
  | hd::tail -> hd + sum tail  
;;
```

what happens
next

Idea: Focus on what happens after the recursive call.

Extracting that piece:

hd +

result of recursive
call gets plugged in
here

How do we capture it?

Question

40

How do we capture that computation?

Question

41

How do we capture that computation?

hd +

fun s -> hd +

```
let rec sum (l:int list) : int =  
  match l with  
  [] -> 0  
  | hd::tail -> hd + sum tail  
;;
```

```
type cont = int -> int;;  
  
let rec sum_cont (l:int list) (k:cont): int =  
  match l with  
  [] -> k 0  
  | hd::tail -> sum_cont tail (fun s -> ???) ;;
```

Question

42

How do we capture that computation?

hd +

fun s -> hd +

```
let rec sum (l:int list) : int =  
  match l with  
  [] -> 0  
  | hd::tail -> hd + sum tail  
;;
```

```
type cont = int -> int;;  
  
let rec sum_cont (l:int list) (k:cont): int =  
  match l with  
  [] -> k 0  
  | hd::tail -> sum_cont tail (fun s -> k (hd + s)) ;;
```

Question

43

How do we capture that computation?

hd +

fun s -> hd +

```
let rec sum (l:int list) : int =  
  match l with  
  [] -> 0  
  | hd::tail -> hd + sum tail  
;;
```

```
type cont = int -> int;;  
  
let rec sum_cont (l:int list) (k:cont): int =  
  match l with  
  [] -> k 0  
  | hd::tail -> sum_cont tail (fun s -> k (hd + s)) ;;  
  
let sum (l:int list) : int = ??
```

Question

44

How do we capture that computation?

hd +

fun s -> hd +

```
let rec sum (l:int list) : int =  
  match l with  
  [] -> 0  
  | hd::tail -> hd + sum tail  
;;
```

```
type cont = int -> int;;  
  
let rec sum_cont (l:int list) (k:cont): int =  
  match l with  
  [] -> k 0  
  | hd::tail -> sum_cont tail (fun s -> k (hd + s)) ;;  
  
let sum (l:int list) : int = sum_cont l (fun s -> s)
```

Execution

45

```
type cont = int -> int;;

let rec sum_cont (l:int list) (k:cont): int =
  match l with
  | [] -> k 0
  | hd::tail -> sum_cont tail (fun s -> k (hd + s)) ;;

let sum (l:int list) : int = sum_cont l (fun s -> s)
```

```
sum [1;2]
```

Execution

46

```
type cont = int -> int;;

let rec sum_cont (l:int list) (k:cont): int =
  match l with
  | [] -> k 0
  | hd::tail -> sum_cont tail (fun s -> k (hd + s)) ;;

let sum (l:int list) : int = sum_cont l (fun s -> s)
```

```
sum [1;2]
-->
sum_cont [1;2] (fun s -> s)
```

Execution

  | [] -> k 0
  | hd::tail -> sum_cont tail (fun s -> k (hd + s)) ;;

let sum (l:int list) : int = sum_cont l (fun s -> s)
```

```
sum [1;2]
-->
sum_cont [1;2] (fun s -> s)
-->
sum_cont [2] (fun s -> (fun s -> s) (1 + s));;
-->
sum_cont [] (fun s -> (fun s -> (fun s -> s) (1 + s)) (2 + s))
-->
(fun s -> (fun s -> (fun s -> s) (1 + s)) (2 + s)) 0
-->
(fun s -> (fun s -> s) (1 + s)) (2 + 0))
-->
(fun s -> s) (1 + (2 + 0))
-->
1 + (2 + 0)
-->
3
```

Question

53

```
type cont = int -> int;;

let rec sum_cont (l:int list) (k:cont): int =
  match l with
  | [] -> k 0
  | hd::tail -> sum_cont tail (fun s -> k (hd + s)) ;;

let sum (l:int list) : int = sum_cont l (fun s -> s)
```

```
sum [1;2]
-->
sum_cont [1;2] (fun s -> s)
-->
sum_cont [2] (fun s -> (fun s -> s) (1 + s));;
-->
sum_cont [] (fun s -> (fun s -> (fun s -> s) (1 + s)) (2 + s))
-->
...
-->
3
```

Where did the stack space go?

```
sum_cont []  
  (fun s3 ->  
    (fun s2 ->  
      (fun s1 -> s1) (hd1 + s2)  
    ) (hd2 + s3)  
  )
```

function inside

sum_cont []
(fun s3 ->
  (fun s2 ->
    (fun s1 -> s1) (hd1 + s2)
  ) (hd2 + s3)
)
```

Continuation-passing style

57

```
let rec sum_cont (l:int list) (k:cont): int =  
  match l with  
  | [] -> k 0  
  | hd::tail -> sum_cont tail (fun s -> k (hd + s)) ;;
```

Continuation-passing style

58

Continuation-passing style

59

```
let rec sum_to_cont (n:int) (k:int->int) : int =  
  if n > 0 then  
    sum_to_cont (n-1) (fun s -> k (n+s))  
  else  
    k 0 ;;  
  
sum_to_cont 100 (fun s -> s)
```

Continuation-passing style

60

```
let rec sum_to_cont (n:int) (k:int->int) : int =  
  if n > 0 then  
    sum_to_cont (n-1) (fun s -> k (n+s))  
  else  
    k 0 ;;  
  
sum_to_cont 100 (fun s -> s)
```

Continuation-passing style

61

```
let rec sum_to_cont (n:int) (k:int->int) : int =  
  if n > 0 then  
    sum_to_cont (n-1) (fun s -> k (n+s))  
  else  
    k 0 ;;  
  
sum_to 100 (fun s -> s)
```

Back to stacks

62

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 100
```

Back to stacks

63

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 100
```

but how do you really implement that?

Back to stacks

64

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
  
sum_to 100
```

but how do you really implement that?

there is two bits of information here:

- (1) some state ($n=100$) we had to remember
- (2) some code we have to run later

Back to stacks

65

```
let rec sum_to (n:int) : int =  
  if n > 0 then  
    n + sum_to (n-1)  
  else  
    0  
;;  
sum_to 100
```

with reality added

stack

sum_to 98

fun s stack ->
return (stack.n+s)

fun s stack ->
return (stack.n+s)

sum_to_cont 98 k3

fun s env ->
env.k (env.n + s)

n = 99
k =

fun s env ->
env.k (env.n + s)

n = 100
k =

fun s env -> s

with the stack

with the heap

Why CPS?

68

Continuation-passing style is *inevitable*.

It does not matter whether you program in Java or C or OCaml -- there's code around that tells you “*what to do next*”

- If you explicitly CPS-convert your code, “*what to do next*” is stored on the heap
- If you don't, it's stored on the stack

If you take a conventional compilers class, the continuation will be called a *return address* (but you'll know what it really is!)

The idea of a *continuation* is much more general!

Your compiler can put all the continuations in the heap so you don't have to (and you don't run out of stack space)!

Other pros:

- light-weight concurrent threads

Some cons:

- hardware architectures optimized to use a stack
- need tight integration with a good garbage collector

see

[Empirical and Analytic Study of Stack versus Heap Cost for Languages with Closures](#). Shao & Appel

Call-backs: Another use of continuations

70

Call-backs:

```
request_url : url -> (html -> 'a) -> 'a  
request_url http://www.stuff.com/i.html  
  (fun html -> process html)
```

continuation

CPS is interesting and important:

- *unavoidable*
 - assembly language is continuation-passing
- *theoretical ramifications*
 - fixes evaluation order
 - call-by-value evaluation == call-by-name evaluation
- *efficiency*
 - generic way to create tail-recursive functions
 - Appel's SML/NJ compiler based on this style
- *continuation-based programming*
 - call-backs
 - programming with "*what to do next*"
- *implementation-technique for concurrency*

Overall Summary

72

We developed techniques for reasoning about the space costs of functional programs

- the cost of *manipulating data types* like tuples and trees
- the cost of allocating and *using function closures*
- the cost of *tail-recursive* and non-tail-recursive *functions*

We also talked about some important program transformations:

- *closure conversion* makes nested functions with free variables in to pairs of closed code and environment
- the *continuation-passing style* (CPS) transformation turns non-tail-recursive functions in to tail-recursive ones that use no stack space
 - the stack gets moved in to the function closure
- since stack space is often small compared with heap space, it is often necessary to use *continuations and tail recursion*
 - but full CPS-converted programs are unreadable: use judgement

Challenge: CPS Convert the incr function

73

```
type tree = Leaf | Node of int * tree * tree ;;

let rec incr (t:tree) (i:int) : tree =
  match t with
  | Leaf -> Leaf
  | Node (j,left,right) -> Node (i+j, incr left i, incr right i)
;;
```

Hint 1: introduce one let expression for each function call:

let x = incr left i in ...

Hint 2: you will need two continuations

CORRECTNESS OF A CPS TRANSFORM

Are the two functions the same?

75

```
type cont = int -> int;;

let rec sum_cont (l:int list) (k:cont): int =
  match l with
  | [] -> k 0
  | hd::tail -> sum_cont tail (fun s -> k (hd + s)) ;;

let sum2 (l:int list) : int = sum_cont l (fun s -> s)
```

```
let rec sum (l:int list) : int =
  match l with
  | [] -> 0
  | hd::tail -> hd + sum tail
;;
```

Here, it is really pretty tricky to be sure you've done it right if you don't prove it. Let's try to prove this theorem and see what happens:

```
for all l:int list,
  sum_cont l (fun x -> x) == sum l
```

Attempting a Proof

76

```
for all l:int list, sum_cont l (fun s -> s) == sum l
```

Proof: By induction on the structure of the list l.

```
case l = []
```

```
...
```

```
case: hd::tail
```

```
  IH: sum_cont tail (fun s -> s) == sum tail
```

Attempting a Proof

77

```
for all l:int list, sum_cont l (fun s -> s) == sum l
```

Proof: By induction on the structure of the list l.

```
case l = []
```

```
...
```

```
case: hd::tail
```

```
  IH: sum_cont tail (fun s -> s) == sum tail
```

```
    sum_cont (hd::tail) (fun s -> s)  
==
```

Attempting a Proof

78

```
for all l:int list, sum_cont l (fun s -> s) == sum l
```

Proof: By induction on the structure of the list l.

```
case l = []
```

```
...
```

```
case: hd::tail
```

```
  IH: sum_cont tail (fun s -> s) == sum tail
```

```
    sum_cont (hd::tail) (fun s -> s)  
== sum_cont tail (fn s' -> (fn s -> s) (hd + s')) (eval)
```

Attempting a Proof

79

```
for all l:int list, sum_cont l (fun s -> s) == sum l
```

Proof: By induction on the structure of the list l.

```
case l = []
```

```
...
```

```
case: hd::tail
```

```
  IH: sum_cont tail (fun s -> s) == sum tail
```

```
    sum_cont (hd::tail) (fun s -> s)
== sum_cont tail (fn s' -> (fn s -> s) (hd + s')) (eval)
== sum_cont tail (fn s' -> hd + s') (eval -- hd + s' valuable)
```

Need to Generalize the Theorem and IH

80

```
for all l:int list, sum_cont l (fun s -> s) == sum l
```

Proof: By induction on the structure of the list l.

```
case l = []
```

```
...
```

```
case: hd::tail
```

```
  IH: sum_cont tail (fun s -> s) == sum tail
```

```
    sum_cont (hd::tail) (fun s -> s)
== sum_cont tail (fn s' -> (fn s -> s) (hd + s')) (eval)
== sum_cont tail (fn s' -> hd + s') (eval -- hd + s' valuable)
== darn!
```

we'd like to use the IH, but we can't!
we might like:

```
sum_cont tail (fn s' -> hd + s') == sum tail
```

... but that's not even true

not the identity continuation
(fun s -> s) like the IH requires

== k (hd + (sum tail))                      (eval sum, reverse)  
== k (sum (hd::tail))
```

case done!

QED!

Finishing Up

94

Ok, now what we have is a proof of this theorem:

```
for all l:int list,  
  for all k:int->int, sum_cont l k == k (sum l)
```

We can use that general theorem to get what we really want:

```
for all l:int list,  
  sum2 l  
== sum_cont l (fun s -> s)      (by eval sum2)  
== (fun s -> s) (sum l)         (by theorem, instantiating k with (fun s -> s))  
== sum l                       (by eval, since sum l valuable)
```

So, we've show that the function sum2, which is tail-recursive, is functionally equivalent to the non-tail-recursive function sum.

SUMMARY

Summary of the CPS Proof

96

We tried to prove the *specific* theorem we wanted:

```
for all l:int list, sum_cont l (fun s -> s) == sum l
```

But it didn't work because in the middle of the proof, *the IH didn't apply* -- inside our function we had the wrong kind of continuation -- not (fun s -> s) like our IH required. So we had to *prove a more general theorem* about *all* continuations.

```
for all l:int list,  
  for all k:int->int, sum_cont l k == k (sum l)
```

This is a common occurrence -- *generalizing the induction hypothesis* -- and it requires human ingenuity. It's why proving theorems is hard. It's also why writing programs is hard -- you have to make the proofs and programs work more generally, around every iteration of a loop.

Overall Summary

97

We developed techniques for reasoning about the space costs of functional programs

- the cost of *manipulating data types* like tuples and trees
- the cost of allocating and *using function closures*
- the cost of *tail-recursive* and non-tail-recursive *functions*

We also talked about some important program transformations:

- *closure conversion* makes nested functions with free variables into pairs of closed code and environment
- the *continuation-passing style* (CPS) transformation turns non-tail-recursive functions into tail-recursive ones that use no stack space
 - the stack gets moved into the function closure
- since stack space is often small compared with heap space, it is often necessary to use *continuations and tail recursion*
 - but full CPS-converted programs are unreadable: use judgement

Challenge: CPS Convert the incr function

98

```
type tree = Leaf | Node of int * tree * tree ;;

let rec incr (t:tree) (i:int) : tree =
  match t with
  | Leaf -> Leaf
  | Node (j,left,right) -> Node (i+j, incr left i, incr right i)
;;
```

(see solution after the next slide)

Solution:

CPS CONVERT THE INCR FUNCTION

CPS Convert the incr function

100

```
type tree = Leaf | Node of int * tree * tree ;;

let rec incr (t:tree) (i:int) : tree =
  match t with
  | Leaf -> Leaf
  | Node (j,left,right) -> Node (i+j, incr left i, incr right i)
;;
```

```
type cont = tree -> tree ;;

let rec incr_cps (t:tree) (i:int) (k:cont) : tree =
  match t with
  | Leaf -> k Leaf
  | Node (j,left,right) -> ...
;;
```

```
type tree = Leaf | Node of int * tree * tree ;;
```

```
let rec incr (t:tree) (i:int) : tree =
  match t with
  | Leaf -> Leaf
  | Node (j,left,right) -> Node (i+j, incr left i, incr right i)
;;
```

first continuation:

```
Node (i+j, _____ , incr right i)
```

second continuation:

```
Node (i+j, left_done, _____ )
```

```
type tree = Leaf | Node of int * tree * tree ;;
```

102

```
let rec incr (t:tree) (i:int) : tree =  
  match t with  
  | Leaf -> Leaf  
  | Node (j,left,right) -> Node (i+j, incr i left, incr i right)  
;;
```

first continuation:

```
fun left_done -> Node (i+j, left_done , incr right i)
```

second continuation:

```
fun right_done -> k (Node (i+j, left_done, right_done))
```

```
type tree = Leaf | Node of int * tree * tree ;;
