

Number Systems and Number Representation

Q: Why do computer programmers
confuse Christmas and Halloween?

A: Because $25 \text{ Dec} = 31 \text{ Oct}$

1

Goals of this Lecture

Help you learn (or refresh your memory) about:

- The binary, hexadecimal, and octal number systems
- Finite representation of unsigned integers
- Finite representation of signed integers
- Finite representation of rational numbers (if time)

Why?

- A power programmer must know number systems and data representation to fully understand C's **primitive data types**

Primitive values and
the operations on them

2

Agenda

Number Systems

Finite representation of unsigned integers

Finite representation of signed integers

Finite representation of rational numbers (if time)

3

The Decimal Number System

Name

- "decem" (Latin) $\Rightarrow$ ten

Characteristics

- Ten symbols
 - 0 1 2 3 4 5 6 7 8 9
- Positional
 - $2945 \neq 2495$
 - $2945 = (2 \cdot 10^3) + (9 \cdot 10^2) + (4 \cdot 10^1) + (5 \cdot 10^0)$

(Most) people use the decimal number system

4

The Binary Number System

binary

adjective: being in a state of one of two mutually exclusive conditions such as on or off, true or false, molten or frozen, presence or absence of a signal. From Late Latin *binārus* ("consisting of two").

Characteristics

- Two symbols
 - 0 1
- Positional
 - $1010_2 \neq 1100_2$

Most (digital) computers use the binary number system

Terminology

- **Bit**: a binary digit
- **Byte**: (typically) 8 bits

5

Decimal-Binary Equivalence

Decimal	Binary
0	0
1	1
2	10
3	11
4	100
5	101
6	110
7	111
8	1000
9	1001
10	1010
11	1011
12	1100
13	1101
14	1110
15	1111

Decimal	Binary
16	10000
17	10001
18	10010
19	10011
20	10100
21	10101
22	10110
23	10111
24	11000
25	11001
26	11010
27	11011
28	11100
29	11101
30	11110
31	11111
...	...

6

Decimal-Binary Conversion

7

Binary to decimal: expand using positional notation

$$\begin{aligned} 100101_B &= (1 \cdot 2^5) + (0 \cdot 2^4) + (0 \cdot 2^3) + (1 \cdot 2^2) + (0 \cdot 2^1) + (1 \cdot 2^0) \\ &= 32 + 0 + 0 + 4 + 0 + 1 \\ &= 37 \end{aligned}$$

~~Integer~~ Decimal-Binary Conversion

8

Integer
~~Binary to decimal:~~ expand using positional notation

$$\begin{aligned} 100101_B &= (1 \cdot 2^5) + (0 \cdot 2^4) + (0 \cdot 2^3) + (1 \cdot 2^2) + (0 \cdot 2^1) + (1 \cdot 2^0) \\ &= 32 + 0 + 0 + 4 + 0 + 1 \\ &= 37 \end{aligned}$$

These are integers
They exist as their pure selves
no matter how we might choose
to represent them with our
fingers or toes

Integer-Binary Conversion

9

Integer to binary: do the reverse

- Determine largest power of 2 $\leq$ number; write template

$$37 = (? \cdot 2^5) + (? \cdot 2^4) + (? \cdot 2^3) + (? \cdot 2^2) + (? \cdot 2^1) + (? \cdot 2^0)$$

- Fill in template

$$\begin{array}{r} 37 = (1 \cdot 2^5) + (0 \cdot 2^4) + (0 \cdot 2^3) + (1 \cdot 2^2) + (0 \cdot 2^1) + (1 \cdot 2^0) \\ \underline{-32} \\ 5 \\ \underline{-4} \\ 1 \\ \underline{-1} \\ 0 \end{array} \quad 100101_B$$

Integer-Binary Conversion

10

Integer to binary shortcut

- Repeatedly divide by 2, consider remainder

$$\begin{array}{r} 37 / 2 = 18 \text{ R } 1 \\ 18 / 2 = 9 \text{ R } 0 \\ 9 / 2 = 4 \text{ R } 1 \\ 4 / 2 = 2 \text{ R } 0 \\ 2 / 2 = 1 \text{ R } 0 \\ 1 / 2 = 0 \text{ R } 1 \end{array}$$

Read from bottom
to top: 100101_B

The Hexadecimal Number System

11

Name

- "hexa" (Greek) $\Rightarrow$ six
- "decem" (Latin) $\Rightarrow$ ten

Characteristics

- Sixteen symbols
- 0 1 2 3 4 5 6 7 8 9 A B C D E F
- Positional
- $A13D_H \neq 3DA1_H$

Computer programmers often use the hexadecimal number system

Decimal-Hexadecimal Equivalence

12

Decimal	Hex
0	0
1	1
2	2
3	3
4	4
5	5
6	6
7	7
8	8

...	...

Integer-Hexadecimal Conversion

Hexadecimal to integer: expand using positional notation

$$\begin{array}{r} 25_H = (2 \cdot 16^1) + (5 \cdot 16^0) \\ = 32 + 5 \\ = 37 \end{array}$$

Integer to hexadecimal: use the shortcut

$$\begin{array}{r} 37 / 16 = 2 \text{ R } 5 \\ 2 / 16 = 0 \text{ R } 2 \end{array}$$

↑
Read from bottom
to top: 25_H

13

Binary-Hexadecimal Conversion

Observation: $16^1 = 2^4$

- Every 1 hexadecimal digit corresponds to 4 binary digits

Binary to hexadecimal

1010000100111101 _B	A	1	3	D _H
-------------------------------	---	---	---	----------------

Digit count in binary number
not a multiple of 4 $\Rightarrow$
pad with zeros on left

Hexadecimal to binary

A	1	3	D _H
1010000100111101 _B			

Discard leading zeros
from binary number if
appropriate

Is it clear why programmers
often use hexadecimal?

14

The Octal Number System

Name

- "octo" (Latin) $\Rightarrow$ eight

Characteristics

- Eight symbols
- 0 1 2 3 4 5 6 7
- Positional
- $1743_o \neq 7314_o$

Computer programmers often use the octal number system

Why?

(So does Mickey Mouse!)

15

Agenda

Number Systems

Finite representation of unsigned integers

Finite representation of signed integers

Finite representation of rational numbers (if time)

16

Unsigned Data Types: Java vs. C

Java has type:

- int
- Can represent signed integers

C has type:

- signed int
- Can represent signed integers
- int
- Same as signed int
- unsigned int
- Can represent only unsigned integers

To understand C, must consider representation of both
unsigned and signed integers

17

Representing Unsigned Integers

Mathematics

- Range is 0 to ∞

Computer programming

- Range limited by computer's **word** size
- Word size is n bits $\Rightarrow$ range is 0 to $2^n - 1$
- Exceed range $\Rightarrow$ **overflow**

CourseLab computers

- n = 64, so range is 0 to $2^{64} - 1$ (huge!)

Pretend computer

- n = 4, so range is 0 to $2^4 - 1$ (15)

Hereafter, assume word size = 4

- All points generalize to word size = 64, word size = n

18

Representing Unsigned Integers

On pretend computer

Unsigned Integer	Rep
0	0000
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001
10	1010
11	1011
12	1100
13	1101
14	1110
15	1111

19

Adding/subtracting binary numbers

Addition

$$\begin{array}{r} 0011 \\ + 1010 \\ \hline \end{array}$$

Subtraction

$$\begin{array}{r} 1010 \\ - 0111 \\ \hline \end{array}$$

Subtraction

$$\begin{array}{r} 0011 \\ - 1010 \\ \hline \end{array}$$

20

Adding Unsigned Integers

Addition

$$\begin{array}{r} 1 \\ 3 \quad 0011_B \\ + 10 \quad 1010_B \\ \hline 13 \quad 1101_B \end{array}$$

Start at right column
Proceed leftward
Carry 1 when necessary

$$\begin{array}{r} 1 \\ 7 \quad 0111_B \\ + 10 \quad 1010_B \\ \hline 1 \quad 0001_B \end{array}$$

Beware of overflow

How would you detect overflow programmatically?

Results are mod 2^4

21

Subtracting Unsigned Integers

Subtraction

$$\begin{array}{r} 111 \\ 10 \quad 1010_B \\ - 7 \quad 0111_B \\ \hline 3 \quad 0011_B \end{array}$$

Start at right column
Proceed leftward
Borrow when necessary

$$\begin{array}{r} 1 \\ 3 \quad 0011_B \\ - 10 \quad 1010_B \\ \hline 9 \quad 1001_B \end{array}$$

Beware of overflow

How would you detect overflow programmatically?

Results are mod 2^4

22

Shifting Unsigned Integers

Bitwise right shift ($>>$ in C): fill on left with zeros

$$\begin{array}{r} 10 \gg 1 \Rightarrow 5 \\ 1010_B \quad 0101_B \end{array}$$

What is the effect arithmetically?
(No fair looking ahead)

$$\begin{array}{r} 10 \gg 2 \Rightarrow 2 \\ 1010_B \quad 0010_B \end{array}$$

Bitwise left shift ($<<$ in C): fill on right with zeros

$$\begin{array}{r} 5 << 1 \Rightarrow 10 \\ 0101_B \quad 1010_B \end{array}$$

What is the effect arithmetically?
(No fair looking ahead)

$$\begin{array}{r} 3 << 2 \Rightarrow 12 \\ 0011_B \quad 1100_B \end{array}$$

Results are mod 2^4

23

Other Operations on Unsigned Ints

Bitwise NOT ($\sim$ in C)

- Flip each bit

$$\begin{array}{r} \sim 10 \Rightarrow 5 \\ 1010_B \quad 0101_B \end{array}$$

Bitwise AND ($\&$ in C)

- Logical AND corresponding bits

$$\begin{array}{r} 10 \quad 1010_B \\ \& 7 \quad 0111_B \\ \hline 2 \quad 0010_B \end{array}$$

Useful for setting selected bits to 0

24

Other Operations on Unsigned Ints

Bitwise OR: (| in C)

- Logical OR corresponding bits

10	1010 ₂
1	0001 ₂
--	----
11	1011 ₂

Useful for setting
selected bits to 1

Bitwise exclusive OR (^ in C)

- Logical exclusive OR corresponding bits

10	1010 ₂
^ 10	^ 0001 ₂
--	----
0	0000 ₂

$x \wedge x$ sets
all bits to 0

25

Aside: Using Bitwise Ops for Arith

Can use $<<$, $>>$, and $\&$ to do some arithmetic efficiently

$x * 2^y == x << y$
Fast way to **multiply**
by a power of 2

$$3 * 4 = 3 * 2^2 = 3 << 2 \Rightarrow 12$$

$x / 2^y == x >> y$
Fast way to **divide**
unsigned by power of 2

$$13 / 4 = 13 / 2^2 = 13 >> 2 \Rightarrow 3$$

$x \% 2^y == x \& (2^y - 1)$

$$13 \% 4 = 13 \% 2^2 = 13 \& (2^2 - 1) = 13 \& 3 \Rightarrow 1$$

13	1101 ₂
& 3	& 0011 ₂
--	----
1	0001 ₂

26

Aside: Example C Program

```
#include <stdio.h>
#include <stdlib.h>
int main(void)
{
    unsigned int n;
    unsigned int count;
    printf("Enter an unsigned integer: ");
    if (scanf("%u", &n) != 1)
    {
        fprintf(stderr, "Error: Expect unsigned int.\n");
        exit(EXIT_FAILURE);
    }
    for (count = 0; n > 0; n = n >> 1)
        count += (n & 1);
    printf("%u\n", count);
    return 0;
}
```

What does it
write?

How could this be
expressed more
succinctly?

27

Aside from the aside...

Personally, I wouldn't put the (count=0) in the for(;;) initializer,

```
for (count = 0; n > 0; n = n >> 1)
    count += (n & 1);
```

because it's not really part of the loop iterator. In this case, the iterator is n , which (in this case) happens to be already initialized.

So it's perhaps more straightforward to write,

```
count = 0;
for ( ; n > 0; n = n >> 1)
    count += (n & 1);
```

28

Agenda

Number Systems

Finite representation of unsigned integers

Finite representation of signed integers

Finite representation of rational numbers (if time)

Signed Magnitude

Integer	Rep
-7	1111
-6	1110
-5	1101
-4	1100
-3	1011
-2	1010
-1	1001
0	1000
0	0000
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111

Definition

High-order bit indicates sign

0 $\Rightarrow$ positive

1 $\Rightarrow$ negative

Remaining bits indicate magnitude

$$1101_2 = -101_2 = -5$$

$$0101_2 = 101_2 = 5$$

29

30

Signed Magnitude (cont.)

Integer	Rep
-7	1111
-6	1110
-5	1101
-4	1100
-3	1011

1	0000
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111

Computing negative

neg(x) = flip high order bit of x

$$\text{neg}(0101_B) = 1101_B$$

$$\text{neg}(1101_B) = 0101_B$$

Pros and cons

- + easy for people to understand
- + symmetric
- two representations of zero
- can't use the same "add" algorithm for both signed and unsigned numbers

31

Ones' Complement

Definition

High-order bit has weight -7

$$1010_B = (1 \cdot -7) + (0 \cdot 4) + (1 \cdot 2) + (0 \cdot 1)$$

$$= -5$$

$$0010_B = (0 \cdot -7) + (0 \cdot 4) + (1 \cdot 2) + (0 \cdot 1)$$

$$= 2$$

32

Ones' Complement (cont.)

Computing negative

$$\text{neg}(x) = \sim x$$

$$\text{neg}(0101_B) = 1010_B$$

$$\text{neg}(1010_B) = 0101_B$$

Computing negative (alternative)

$$\text{neg}(x) = 1111_B - x$$

$$\text{neg}(0101_B) = 1111_B - 0101_B$$

$$= 1010_B$$

$$\text{neg}(1010_B) = 1111_B - 1010_B$$

$$= 0101_B$$

Pros and cons

- + symmetric
- two reps of zero
- can't use the same "add" algorithm for both signed and unsigned numbers

33

Two's Complement

7	0111

Computing negative

$$\text{neg}(x) = \sim x + 1$$

$$\text{neg}(x) = \text{onescomp}(x) + 1$$

$$\text{neg}(0101_B) = 1010_B + 1 = 1011_B$$

$$\text{neg}(1011_B) = 0100_B + 1 = 0101_B$$

Pros and cons

- not symmetric
- + one representation of zero
- + same algorithm adds unsigned numbers or signed numbers

35

Two's Complement (cont.)

Almost all computers use two's complement to represent signed integers

Why?

- Arithmetic is easy
- Will become clear soon

Hereafter, assume two's complement representation of signed integers

36

Adding Signed Integers

pos + pos (overflow)

11	
3	0011 _B
+ 3	+ 0011 _B
--	----
6	0110 _B

pos + neg

1111

neg + neg

11	
-3	1101 _B
+ -2	+ 1110 _B
--	----
-5	110101 _B

How would you detect overflow programmatically?

neg + pos (overflow)

1 1	
-6	1010 _B
+ -5	+ 1011 _B
--	----
5	10101 _B

37

Subtracting Signed Integers

Perform subtraction with borrows

1	22	
3	0011 _B	
- 4	- 0100 _B	
--	----	
-1	1111 _B	

Compute two's complement and add

3	0011 _B	
+ -4	+ 1100 _B	
--	----	
-1	1111 _B	

-5	1011 _B	
- 2	- 0010 _B	
--	----	
-7	1001 _B	

111	
-5	1011
+ -2	+ 1110
--	----
-7	11001

38

Negating Signed Ints: Math

Question: Why does two's complement arithmetic work?

Answer: $[-b] \bmod 2^4 = [\text{twoscomp}(b)] \bmod 2^4$

$$\begin{aligned}
 [-b] \bmod 2^4 &= [2^4 - b] \bmod 2^4 \\
 &= [2^4 - 1 - b + 1] \bmod 2^4 \\
 &= [(2^4 - 1 - b) + 1] \bmod 2^4 \\
 &= [\text{onescomp}(b) + 1] \bmod 2^4 \\
 &= [\text{twoscomp}(b)] \bmod 2^4
 \end{aligned}$$

See Bryant & O'Hallaron book for much more info

39

Subtracting Signed Ints: Math

And so:

$[a - b] \bmod 2^4 = [a + \text{twoscomp}(b)] \bmod 2^4$

$$\begin{aligned}
 [a - b] \bmod 2^4 &= [a + 2^4 - b] \bmod 2^4 \\
 &= [a + 2^4 - 1 - b + 1] \bmod 2^4 \\
 &= [a + (2^4 - 1 - b) + 1] \bmod 2^4 \\
 &= [a + \text{onescomp}(b) + 1] \bmod 2^4 \\
 &= [a + \text{twoscomp}(b)] \bmod 2^4
 \end{aligned}$$

See Bryant & O'Hallaron book for much more info

40

Shifting Signed Integers

Bitwise left shift ($\ll$ in C): fill on right with zeros

3	$\ll$	1	$\Rightarrow$	6
0011 _B				0110 _B
-3	$\ll$	1	$\Rightarrow$	-6
1101 _B				-1010 _B

What is the effect arithmetically???

Bitwise arithmetic right shift: fill on left with sign bit

6	$\gg$	1	$\Rightarrow$	3
0110 _B				0011 _B
-6	$\gg$	1	$\Rightarrow$	-3
1101 _B				1101 _B

What is the effect arithmetically??

Results are $\bmod 2^4$

41

Shifting Signed Integers (cont.)

Bitwise logical right shift: fill on left with zeros

6	$\gg$	1	$\Rightarrow$	3
0110 _B				0011 _B
-6	$\gg$	1	$\Rightarrow$	5
1010 _B				0101 _B

What is the effect arithmetically???

In C, right shift ($\gg$) could be logical or arithmetic

- Not specified by C90 standard
- Compiler designer decides

Best to avoid shifting signed integers

(if you must shift signed integers, make sure you're on a 2's complement machine, and do a bitwise-and after shifting)

(Java does this better, with two operators: $\gg$ $\gg \gg$)

42

Shifting Signed Integers (cont.)

Is it after 1980?
OK, then we're surely
two's complement

(if you must shift signed integers, make sure you're on a 2's complement machine, and do a bitwise-and after shifting)

43

Other Operations on Signed Ints

Bitwise NOT (~ in C)

- Same as with unsigned ints

Bitwise AND (& in C)

- Same as with unsigned ints

Bitwise OR: (| in C)

- Same as with unsigned ints

Bitwise exclusive OR (^ in C)

- Same as with unsigned ints

Best to avoid with signed integers

44

Agenda

Number Systems

Finite representation of unsigned integers

Finite representation of signed integers

Finite representation of rational numbers (if time)

45

Rational Numbers

Mathematics

- A **rational** number is one that can be expressed as the **ratio** of two integers
- Unbounded range and precision

Computer science

- Finite range and precision
- Approximate using **floating point** number
- Binary point "floats" across bits

46

IEEE Floating Point Representation

Common finite representation: **IEEE floating point**

- More precisely: ISO/IEEE 754 standard

Using 32 bits (type float in C):

- 1 bit: sign (0⇒positive, 1⇒negative)
- 8 bits: exponent + 127
- 23 bits: binary fraction of the form 1.aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa

Using 64 bits (type double in C):

- 1 bit: sign (0⇒positive, 1⇒negative)
- 11 bits: exponent + 1023
- 52 bits: binary fraction of the form 1.aa

47

Floating Point Example

Sign (1 bit):

- 1 ⇒ negative

11000001110110110000000000000000

32-bit representation

Exponent (8 bits):

- 1000001₂ = 131
- 131 - 127 = 4

Fraction (23 bits):

also called "mantissa"

- 1.101101100000000000000000₂
- 1 + (1*2⁻¹) + (0*2⁻²) + (1*2⁻³) + (1*2⁻⁴) + (0*2⁻⁵) + (1*2⁻⁶) + (1*2⁻⁷) = 1.7109375

Number:

- -1.7109375 * 2⁴ = -27.375

48

When was floating-point invented?

Answer: long before computers!

mantissa

noun

decimal part of a logarithm, 1865, from Latin *mantissa* "a worthless addition, makeweight," perhaps a Gaulish word introduced into Latin via Etruscan (cf. Old Irish *meit*, Welsh *maint* "size").

x	0	1	2	3	4	5	6	7	8	9	Δ_m	1	2	3
50	6990	6998	7007	7016	7024	7033	7041	7050	7059	7067	9	1	2	3
51	7076	7084	7093	7101	7110	7118	7126	7135	7143	7152	8	1	2	2
52	7160	7168	7177	7185	7193	7202	7210	7218	7226	7235	8	1	2	2
53	7243	7251	7259	7267	7275	7284	7292	7300	7308	7316	8	1	2	2
54	7324	7332	7340	7348	7356	7364	7372	7380	7388	7396	8	1	2	2
55	7404	7412	7419	7427	7435	7443	7451	7459	7466	7474	8	1	2	2
56	7482	7490	7497	7505	7513	7520	7528	7536	7543	7551	8	1	2	2
57	7559	7566	7574	7581	7589	7597	7604	7612	7619	7627	8	1	2	2
58	7634	7641	7648	7655	7662	7669	7676	7683	7690	7697	7	1	2	2
59	7709	7716	7723	7731	7738	7745	7753	7760	7767	7774	7	1	2	2

Floating Point Warning

Decimal number system can represent only some rational numbers with finite digit count

- Example: $1/3$

Binary number system can represent only some rational numbers with finite digit count

- Example: $1/5$

Beware of **roundoff error**

- Error resulting from inexact representation
- Can accumulate

Decimal Approx	Rational Value
.3	3/10
.33	33/100
.333	333/1000
...	

Binary Approx	Rational Value
0.0	0/2
0.01	1/4
0.010	2/8
0.0011	3/16
0.00110	6/32
0.001101	13/64
0.0011010	26/128
0.00110011	51/256
...	

Summary

The binary, hexadecimal, and octal number systems

Finite representation of unsigned integers

Finite representation of signed integers

Finite representation of rational numbers

Essential for proper understanding of

- C primitive data types
- Assembly language
- Machine language
