# Undirected graphs

Graph. Set of **vertices** connected pairwise by **edges**.

Why study graph algorithms?

- Thousands of practical applications.
- Hundreds of graph algorithms known.
- Interesting and broadly useful abstraction.
- Challenging branch of computer science and discrete math.

# Social networks

---

Vertex = person; edge = social relationship.

“Visualizing Friendships” by Paul Butler

# Protein-protein interaction network

---

Vertex = protein; edge = interaction.

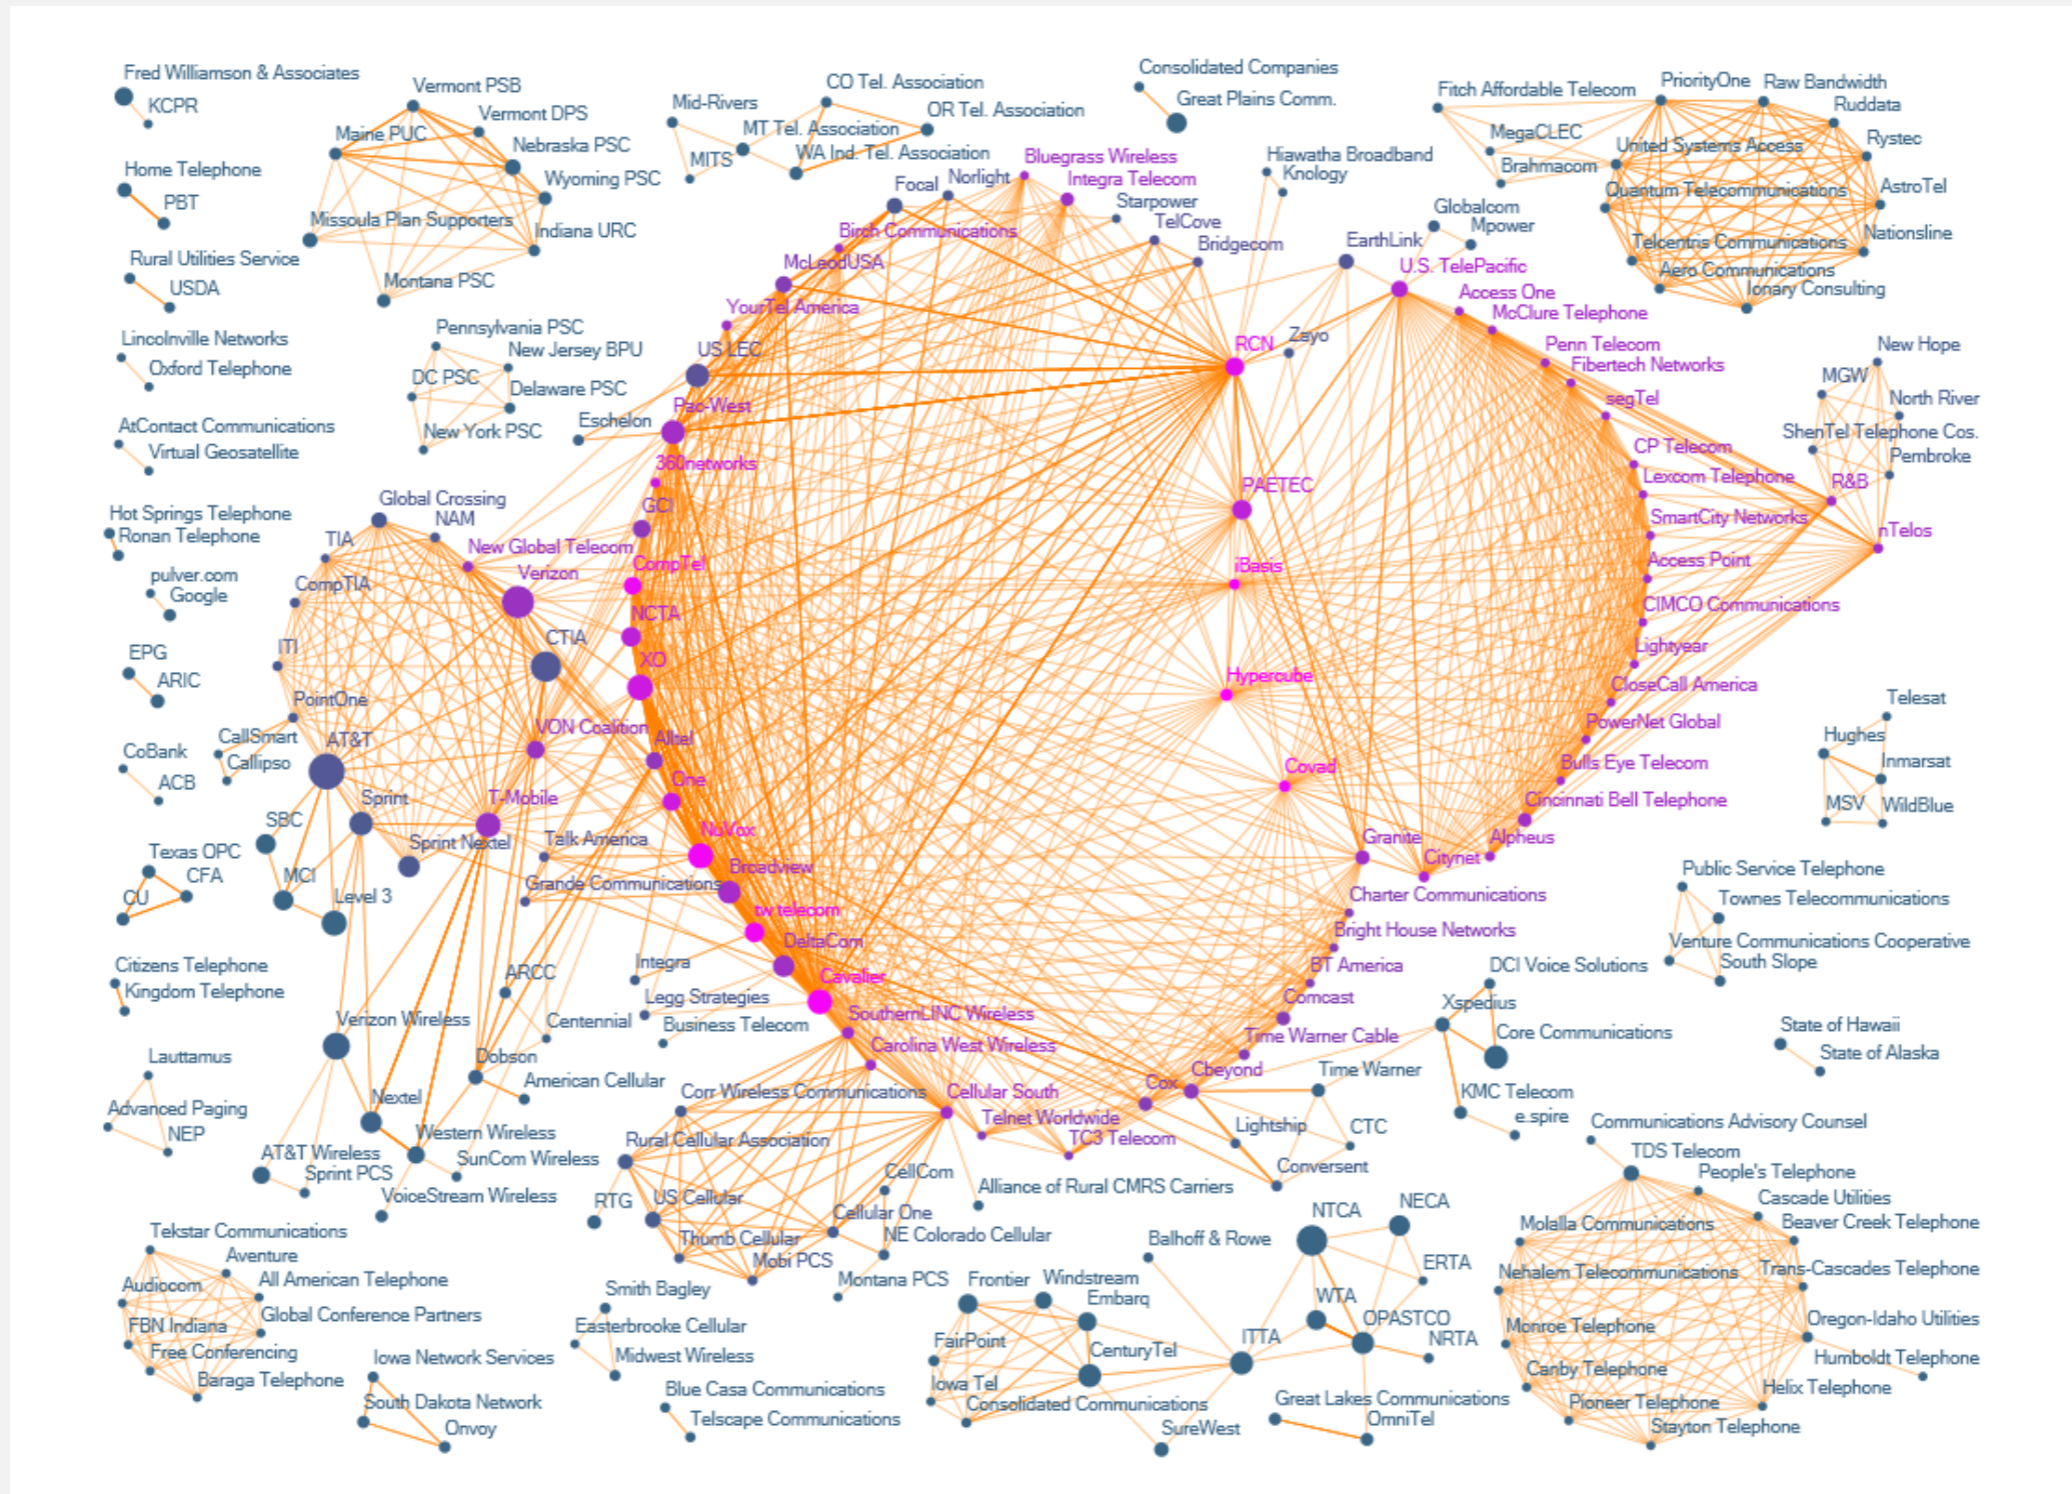

Reference: Jeong et al, Nature Review | Genetics

# The evolution of FCC lobbying coalitions

Vertex = company; edge = lobbying partner.

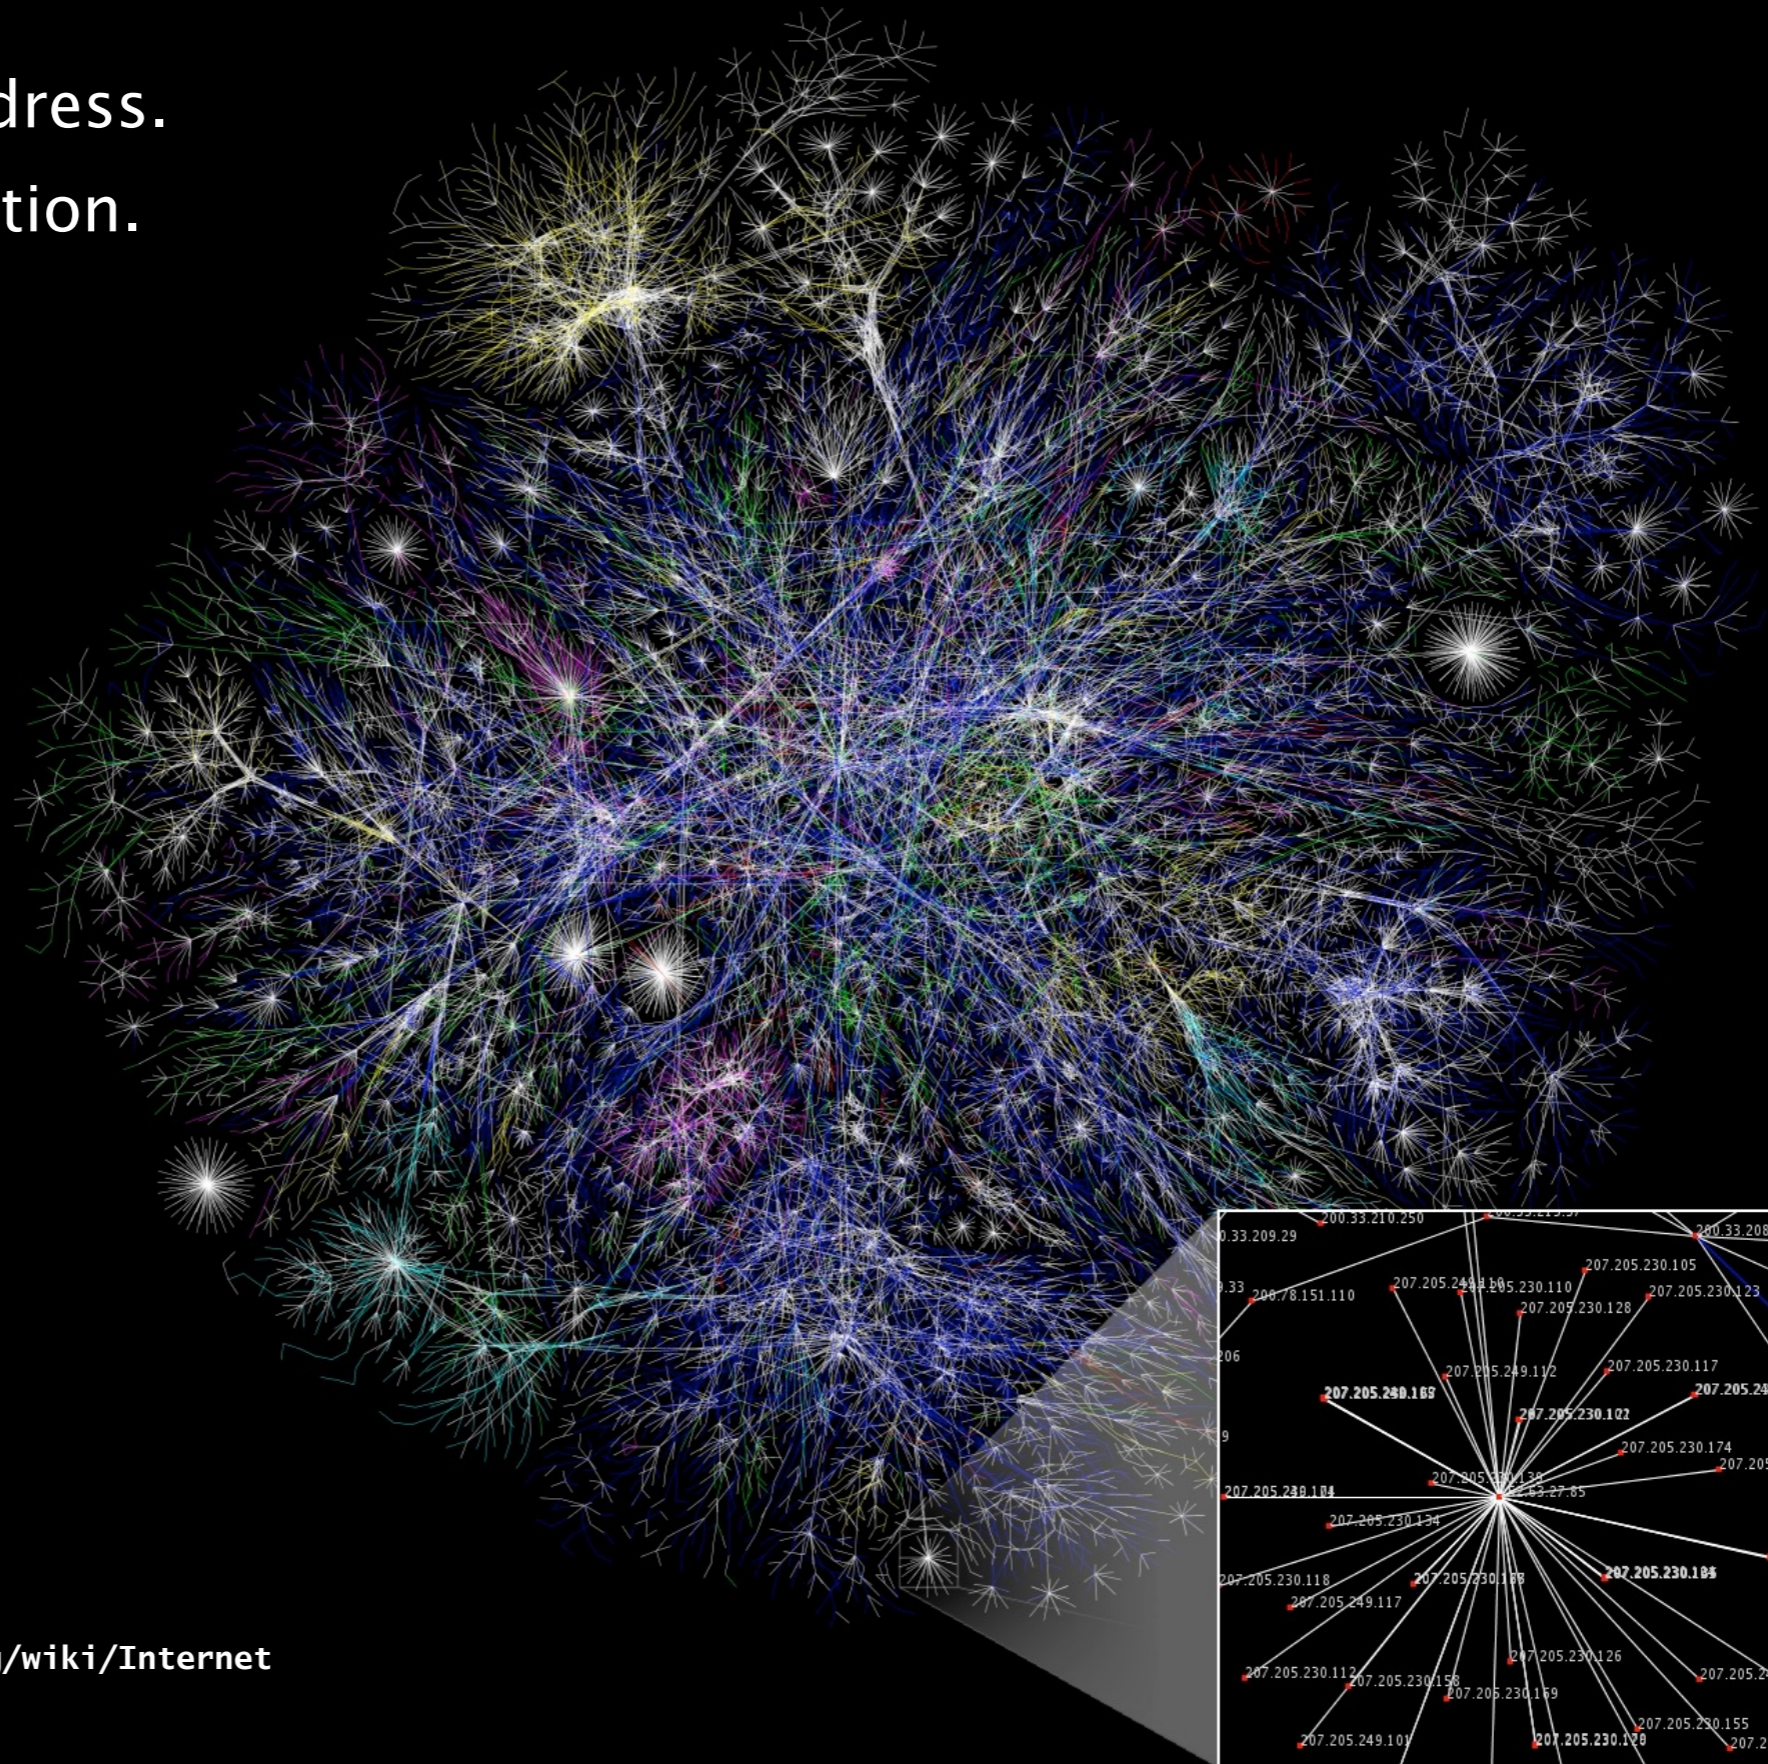

“The Evolution of FCC Lobbying Coalitions” by Pierre de Vries in JoSS Visualization Symposium 2010

# The Internet as mapped by the Opte Project

Vertex = IP address.

Edge = connection.

<http://en.wikipedia.org/wiki/Internet>

# Graph applications

---

<b>graph</b>	<b>vertex</b>	<b>edge</b>
<b>communication</b>	telephone, computer	fiber optic cable
<b>circuit</b>	gate, register, processor	wire
<b>mechanical</b>	joint	rod, beam, spring
<b>financial</b>	stock, currency	transactions
<b>transportation</b>	intersection	street
<b>internet</b>	class C network	connection
<b>game</b>	board position	legal move
<b>social relationship</b>	person	friendship
<b>neural network</b>	neuron	synapse
<b>protein network</b>	protein	protein–protein interaction
<b>molecule</b>	atom	bond

# Graph terminology

---

**Graph.** Set of **vertices** connected pairwise by **edges**.

**Path.** Sequence of vertices connected by edges.

**Def.** Two vertices are **connected** if there is a path between them.

**Cycle.** Path whose first and last vertices are the same.

# Some graph-processing problems

---

problem	description
<b>s-t path</b>	<i>Is there a path between <math>s</math> and <math>t</math> ?</i>
<b>shortest s-t path</b>	<i>What is the shortest path between <math>s</math> and <math>t</math> ?</i>
<b>cycle</b>	<i>Is there a cycle in the graph ?</i>
<b>Euler cycle</b>	<i>Is there a cycle that uses each edge exactly once ?</i>
<b>Hamilton cycle</b>	<i>Is there a cycle that uses each vertex exactly once ?</i>
<b>connectivity</b>	<i>Is there a path between every pair of vertices ?</i>
<b>biconnectivity</b>	<i>Is there a vertex whose removal disconnects the graph ?</i>
<b>planarity</b>	<i>Can the graph be drawn in the plane with no crossing edges ?</i>
<b>graph isomorphism</b>	<i>Are two graphs isomorphic?</i>

**Challenge.** Which graph problems are easy? difficult? intractable?

# Algorithms

# Graph representation

---

**Graph drawing.** Provides intuition about the structure of the graph.

two drawings of the same graph

**Caveat.** Intuition can be misleading.

# Graph representation

---

**Graph drawing.** Provides intuition about the structure of the graph.

**Caveat.** Intuition can be misleading.

# Graph representation

---

## Vertex representation.

- This lecture: use integers between 0 and  $V - 1$ .
- Applications: convert between names and integers with symbol table.

## Anomalies.

# Graph API

---

```
public class Graph
```

```
    Graph(int V)
```

*create an empty graph with V vertices*

```
    Graph(In in)
```

*create a graph from input stream*

```
    void addEdge(int v, int w)
```

*add an edge v-w*

```
    Iterable<Integer> adj(int v)
```

*vertices adjacent to v*

```
    int V()
```

*number of vertices*

```
    int E()
```

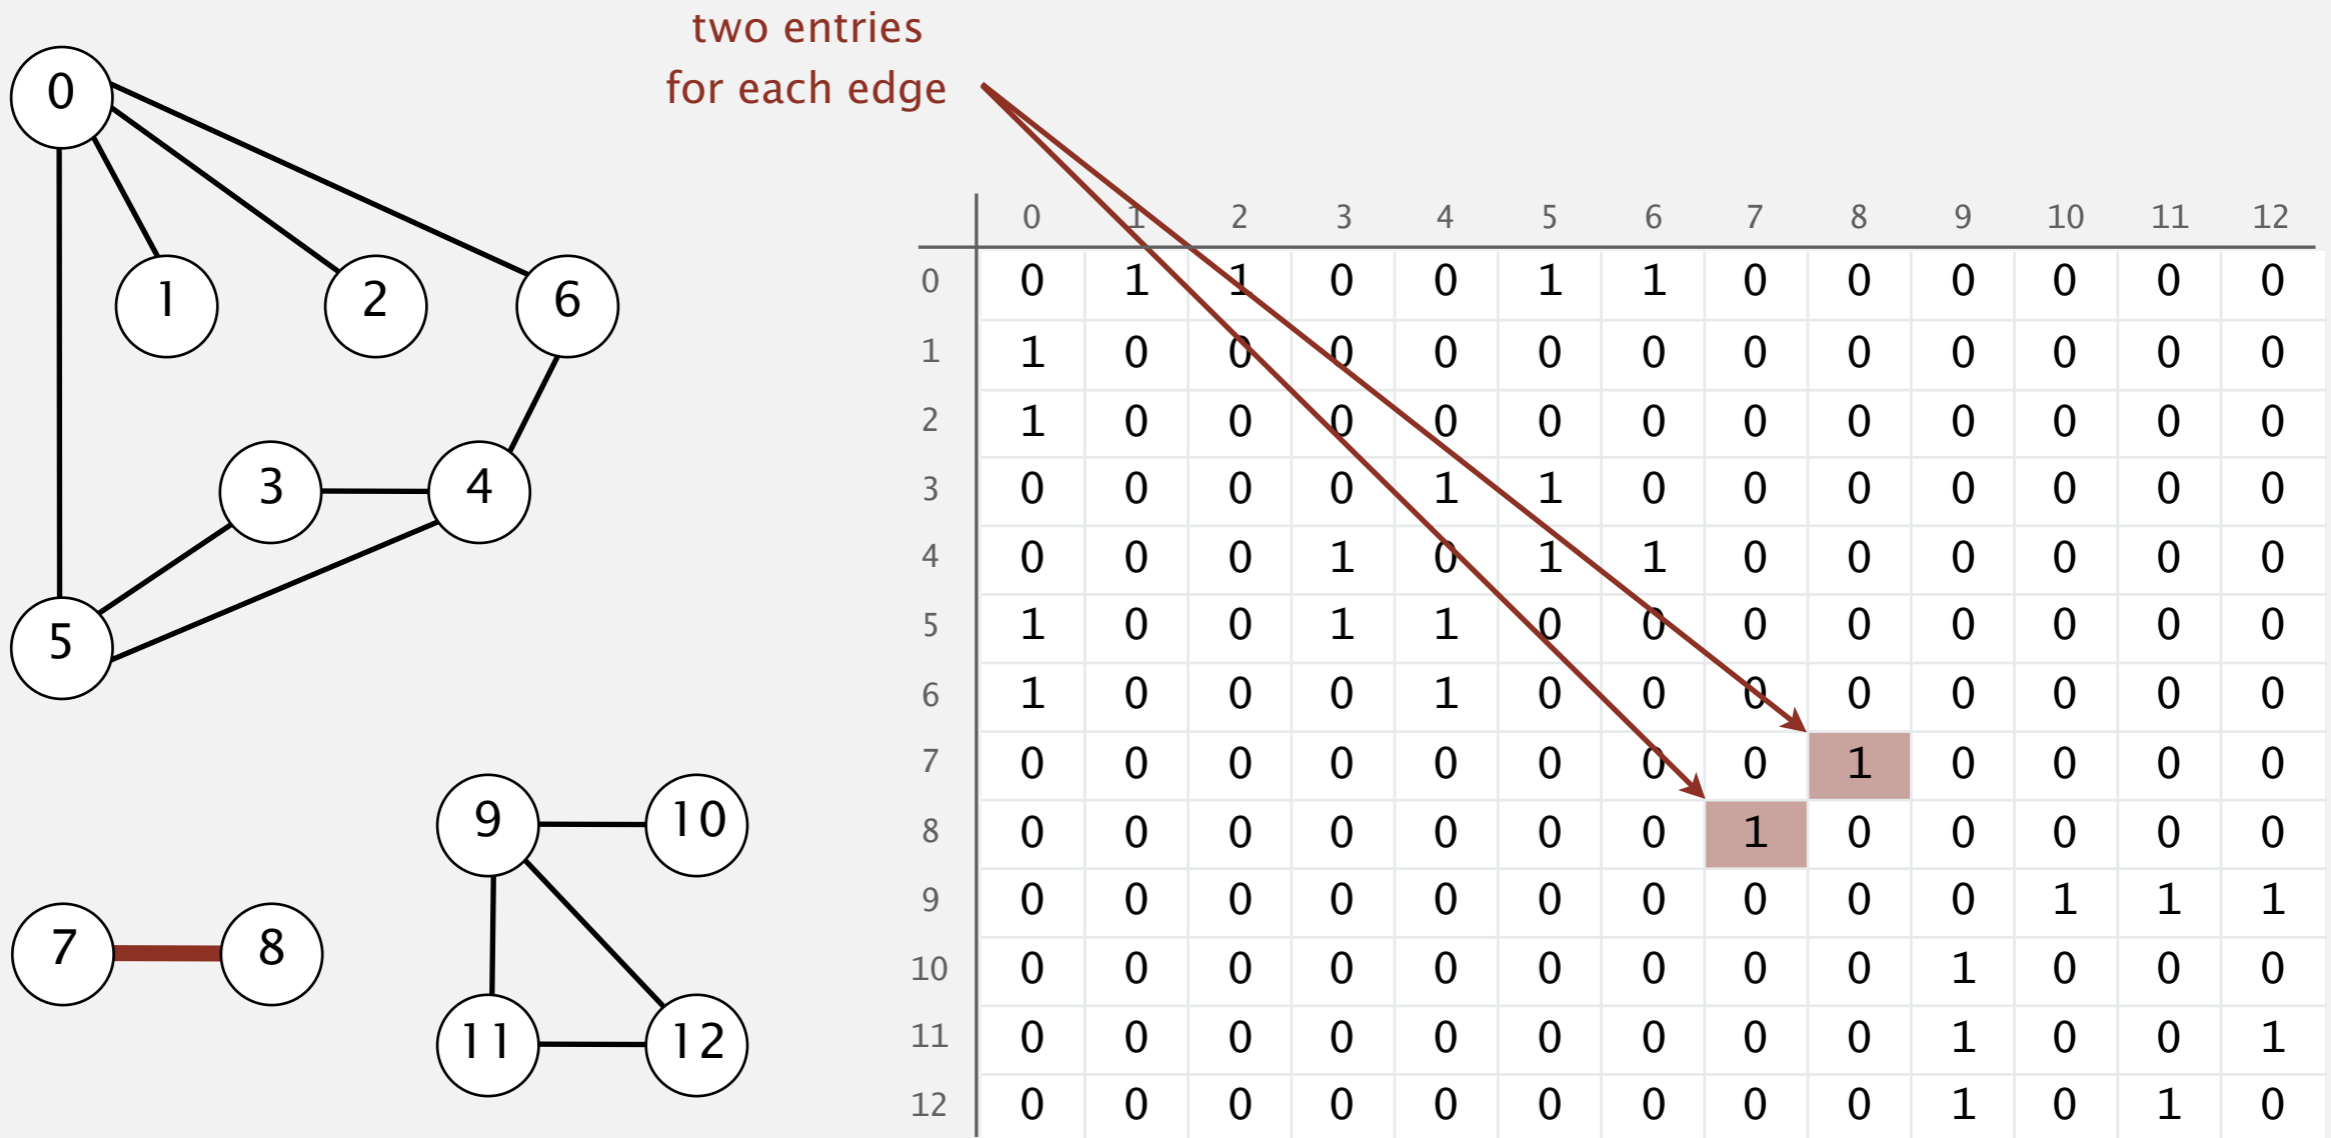

*number of edges*

```
// degree of vertex v in graph G
public static int degree(Graph G, int v)
{
    int degree = 0;
    for (int w : G.adj(v))
        degree++;
    return degree;
}
```

# Graph representation: adjacency matrix

Maintain a two-dimensional  $V$ -by- $V$  boolean array;

for each edge  $v-w$  in graph:  $\text{adj}[v][w] = \text{adj}[w][v] = \text{true}$ .

# Undirected graphs: quiz 1

---

Which is order of growth of running time of the following code fragment if the graph uses the **adjacency-matrix** representation, where  $V$  is the number of vertices and  $E$  is the number of edges?

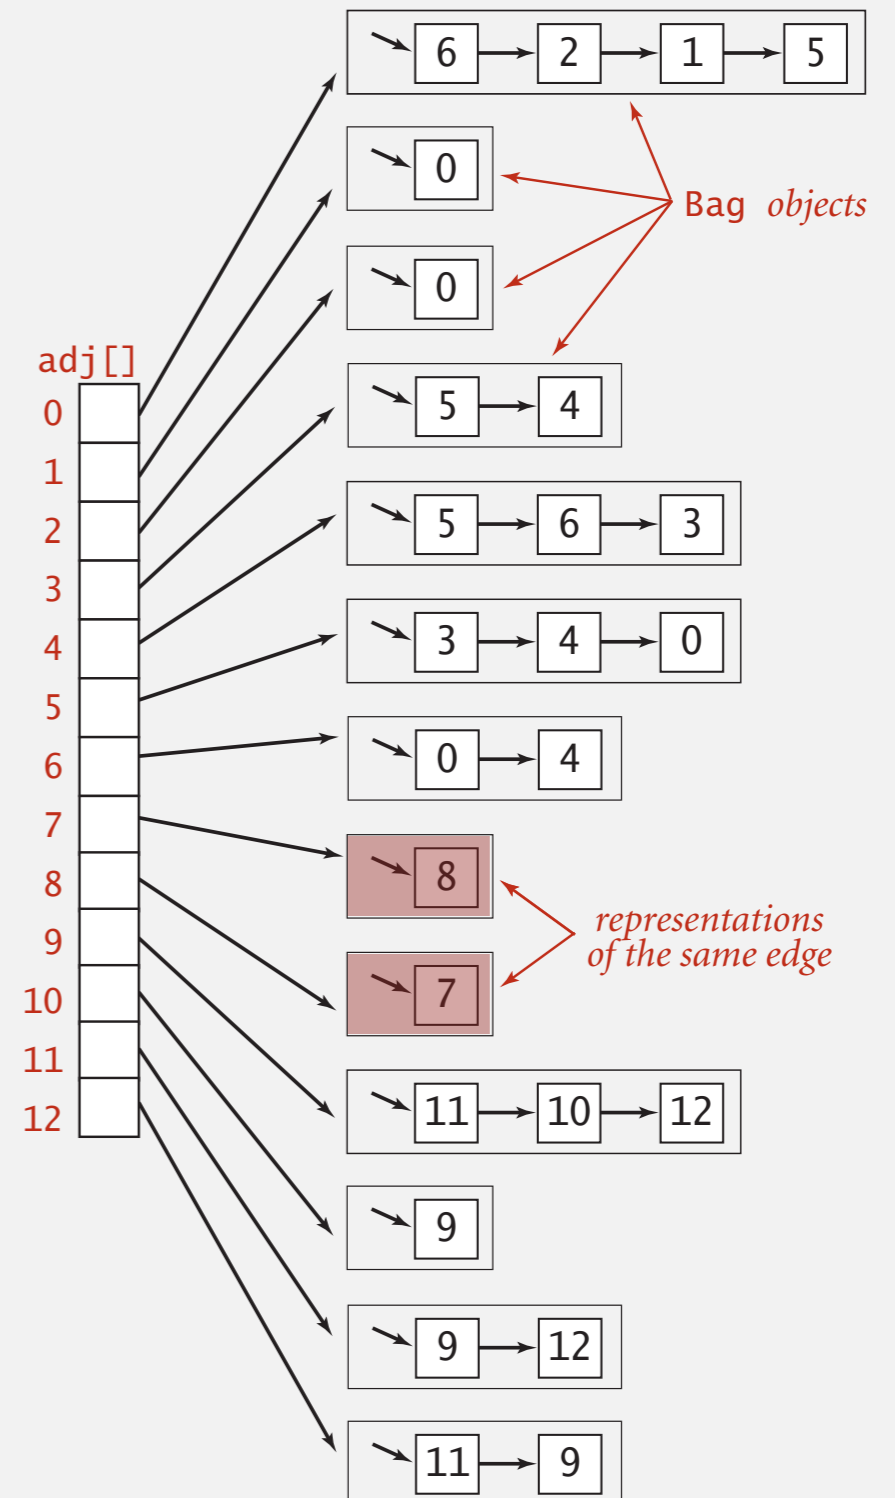

```
for (int v = 0; v < G.V(); v++)  
    for (int w : G.adj(v))  
        StdOut.println(v + "-" + w);
```

print each edge twice

- A.  $V$
- B.  $E + V$
- C.  $V^2$
- D.  $VE$

# Graph representation: adjacency lists

Maintain vertex-indexed array of lists.

## Undirected graphs: quiz 2

---

Which is order of growth of running time of the following code fragment if the graph uses the **adjacency-lists** representation, where  $V$  is the number of vertices and  $E$  is the number of edges?

```
for (int v = 0; v < G.V(); v++)  
    for (int w : G.adj(v))  
        StdOut.println(v + "-" + w);
```

print each edge twice

- A.  $V$
- B.  $E + V$
- C.  $V^2$
- D.  $VE$

# Graph representations

---

**In practice.** Use adjacency-lists representation.

- Algorithms based on iterating over vertices adjacent to  $v$ .
- Real-world graphs tend to be **sparse** (not **dense**).

↑  
proportional  
to  $V$  edges

↑  
proportional  
to  $V^2$  edges

**sparse (E = 200)**

**dense (E = 1000)**

Two graphs ( $V = 50$ )

# Graph representations

---

**In practice.** Use adjacency-lists representation.

- Algorithms based on iterating over vertices adjacent to  $v$ .
- Real-world graphs tend to be **sparse** (not **dense**).

representation	space	add edge	edge between $v$ and $w$ ?	iterate over vertices adjacent to $v$ ?
list of edges	$E$	1	$E$	$E$
adjacency matrix	$V^2$	1 †	1	$V$
adjacency lists	$E + V$	1	$degree(v)$	$degree(v)$

† disallows parallel edges

# Adjacency-list graph representation: Java implementation

---

```
public class Graph  
{
```

```
    private final int V;  
    private Bag<Integer>[] adj;
```

adjacency lists  
( using Bag data type )

```
    public Graph(int V)
```

```
    {  
        this.V = V;  
        adj = (Bag<Integer>[]) new Bag[V];  
        for (int v = 0; v < V; v++)  
            adj[v] = new Bag<Integer>();  
    }
```

create empty graph  
with V vertices

```
    public void addEdge(int v, int w)
```

```
    {  
        adj[v].add(w);  
        adj[w].add(v);  
    }
```

add edge v-w  
(parallel edges and  
self-loops allowed)

```
    public Iterable<Integer> adj(int v)
```

```
    { return adj[v]; }
```

iterator for vertices adjacent to v

```
}
```

- ▶ *introduction*
- ▶ *graph API*
- ▶ *depth-first search*
- ▶ *breadth-first search*
- ▶ *challenges*

# Maze exploration

---

## Maze graph.

- Vertex = intersection.
- Edge = passage.

**Goal.** Explore every intersection in the maze.

# Maze exploration: National Building Museum

---

<http://www.smithsonianmag.com/travel/winding-history-maze-180951998/?no-ist>

# Trémaux maze exploration

---

## Algorithm.

- Unroll a ball of string behind you.
- Mark each newly discovered intersection and passage.
- Retrace steps when no unmarked options.

# Trémaux maze exploration

---

## Algorithm.

- Unroll a ball of string behind you.
- Mark each newly discovered intersection and passage.
- Retrace steps when no unmarked options.

**First use?** Theseus entered Labyrinth to kill the monstrous Minotaur; Ariadne instructed Theseus to use a ball of string to find his way back out.

**The Cretan Labyrinth (with Minotaur)**

<http://commons.wikimedia.org/wiki/File:Minotaurus.gif>

**Claude Shannon (with electromechanical mouse)**

<http://www.corp.att.com/atllabs/reputation/timeline/16shannon.html>

# Maze exploration: easy

---

# Maze exploration: medium

---

# Maze exploration: challenge for the bored

---

# Depth-first search

---

**Goal.** Systematically traverse a graph.

**Idea.** Mimic maze exploration.  function-call stack  
plays role of ball of string

**DFS (to visit a vertex  $v$ )**

---

**Mark vertex  $v$ .**

**Recursively visit all unmarked  
vertices  $w$  adjacent to  $v$ .**

---

**Typical applications.**

- Find all vertices connected to a given source vertex.
- Find a path between two vertices.

**Design challenge.** How to implement?

# Depth-first search demo

To visit a vertex  $v$ :

- Mark vertex  $v$ .
- Recursively visit all unmarked vertices adjacent to  $v$ .

**tinyG.txt**

```
V → 13  
13 ← E  
0 5  
4 3  
0 1  
9 12  
6 4  
5 4  
0 2  
11 12  
9 10  
0 6  
7 8  
9 11  
5 3
```

**graph G**

# Depth-first search demo

To visit a vertex  $v$ :

- Mark vertex  $v$ .
- Recursively visit all unmarked vertices adjacent to  $v$ .

$v$	marked[]	edgeTo[]
0	T	-
1	T	0
2	T	0
3	T	5
4	T	6
5	T	4
6	T	0
7	F	-
8	F	-
9	F	-
10	F	-
11	F	-
12	F	-

vertices reachable from 0

# Design pattern for graph processing

---

**Design pattern.** Decouple graph data type from graph processing.

- Create a Graph object.
- Pass the Graph to a graph-processing routine.
- Query the graph-processing routine for information.

```
public class Paths
```

```
    Paths(Graph G, int s)
```

*find paths in G from source s*

```
    boolean hasPathTo(int v)
```

*is there a path from s to v?*

```
    Iterable<Integer> pathTo(int v)
```

*path from s to v; null if no such path*

```
Paths paths = new Paths(G, s);  
for (int v = 0; v < G.V(); v++)  
    if (paths.hasPathTo(v))  
        StdOut.println(v);
```

← print all vertices  
connected to s

# Depth-first search: data structures

---

To visit a vertex  $v$  :

- Mark vertex  $v$ .
- Recursively visit all unmarked vertices adjacent to  $v$ .

## Data structures.

- Boolean array `marked[]` to mark vertices.
- Integer array `edgeTo[]` to keep track of paths.  
(`edgeTo[w] == v`) means that edge  $v-w$  taken to discover vertex  $w$
- Function-call stack for recursion.

# Depth-first search: Java implementation

```
public class DepthFirstPaths  
{
```

```
    private boolean[] marked;  
    private int[] edgeTo;  
    private int s;
```

← marked[v] = true  
if v connected to s

← edgeTo[v] = previous  
vertex on path from s to v

```
    public DepthFirstPaths(Graph G, int s)  
    {  
        ...  
        dfs(G, s);  
    }
```

← initialize data structures

← find vertices connected to s

```
    private void dfs(Graph G, int v)  
    {  
        marked[v] = true;  
        for (int w : G.adj(v))  
            if (!marked[w])  
            {  
                edgeTo[w] = v;  
                dfs(G, w);  
            }  
    }  
}
```

← recursive DFS does the work

# Depth-first search: properties

---

**Proposition.** DFS marks all vertices connected to  $s$  in time proportional to the sum of their degrees (plus time to initialize the `marked[]` array).

**Pf.** [correctness]

- If  $w$  marked, then  $w$  connected to  $s$  (why?)
- If  $w$  connected to  $s$ , then  $w$  marked.  
(if  $w$  unmarked, then consider last edge on a path from  $s$  to  $w$  that goes from a marked vertex to an unmarked one).

**Pf.** [running time]

Each vertex connected to  $s$  is visited once.

# Depth-first search: properties

**Proposition.** After DFS, can check if vertex  $v$  is connected to  $s$  in constant time and can find  $v$ - $s$  path (if one exists) in time proportional to its length.

**Pf.** `edgeTo[]` is parent-link representation of a tree rooted at vertex  $s$ .

```
public boolean hasPathTo(int v)
{ return marked[v]; }

public Iterable<Integer> pathTo(int v)
{
    if (!hasPathTo(v)) return null;
    Stack<Integer> path = new Stack<Integer>();
    for (int x = v; x != s; x = edgeTo[x])
        path.push(x);
    path.push(s);
    return path;
}
```

# FLOOD FILL

**Problem.** Implement flood fill (Photoshop magic wand).

# NON-RECURSIVE DFS

**Challenge.** Implement DFS without recursion.

<http://algs4.cs.princeton.edu>

## 4.1 UNDIRECTED GRAPHS

---

- ▶ *introduction*
- ▶ *graph API*
- ▶ *depth-first search*
- ▶ *breadth-first search*
- ▶ *challenges*

# Graph search

---

**Tree traversal.** Many ways to explore every vertex in a binary tree.

- Inorder: A C E H M R S X
- Preorder: S E A C R H M X
- Postorder: C A M H R E X S
- Level-order: S E X A R C H M

**Graph search.** Many ways to explore every vertex in a graph.

- Preorder: vertices in order of calls to  $\text{dfs}(G, v)$ .
- Postorder: vertices in order of returns from  $\text{dfs}(G, v)$ .
- Level-order: vertices in increasing order of distance from  $s$ .

# Breadth-first search demo

---

Repeat until queue is empty:

- Remove vertex  $v$  from queue.
- Add to queue all unmarked vertices adjacent to  $v$  and mark them.

- Add to queue all unmarked vertices adjacent to  $v$  and mark them.

$v$	edgeTo[]	distTo[]
0	-	0
1	0	1
2	0	1
3	2	2
4	2	2
5	0	1

done

# Breadth-first search

---

Repeat until queue is empty:

- Remove vertex  $v$  from queue.
- Add to queue all unmarked vertices adjacent to  $v$  and mark them.

**BFS** (from source vertex  $s$ )

---

Put  $s$  onto a FIFO queue, and mark  $s$  as visited.

Repeat until the queue is empty:

- remove the least recently added vertex  $v$
  - add each of  $v$ 's unmarked neighbors to the queue, and mark them.
- 

# Breadth-first search: Java implementation

---

```
public class BreadthFirstPaths
{
    private boolean[] marked;
    private int[] edgeTo;
    private int[] distTo;

    ...

```

```
private void bfs(Graph G, int s) {
    Queue<Integer> q = new Queue<Integer>();
    q.enqueue(s);
    marked[s] = true;
    distTo[s] = 0;

    while (!q.isEmpty()) {
        int v = q.dequeue();
        for (int w : G.adj(v)) {
            if (!marked[w]) {
                q.enqueue(w);
                marked[w] = true;
                edgeTo[w] = v;
                distTo[w] = distTo[v] + 1;
            }
        }
    }
}

```

initialize FIFO queue of  
vertices to explore

found new vertex w  
via edge v-w

# Breadth-first search properties

---

Q. In which order does BFS examine vertices?

A. Increasing distance (number of edges) from  $s$ .

↑  
queue always consists of  $\geq 0$  vertices of distance  $k$  from  $s$ ,  
followed by  $\geq 0$  vertices of distance  $k+1$

**Proposition.** In any connected graph  $G$ , BFS computes shortest paths from  $s$  to all other vertices in time proportional to  $E + V$ .

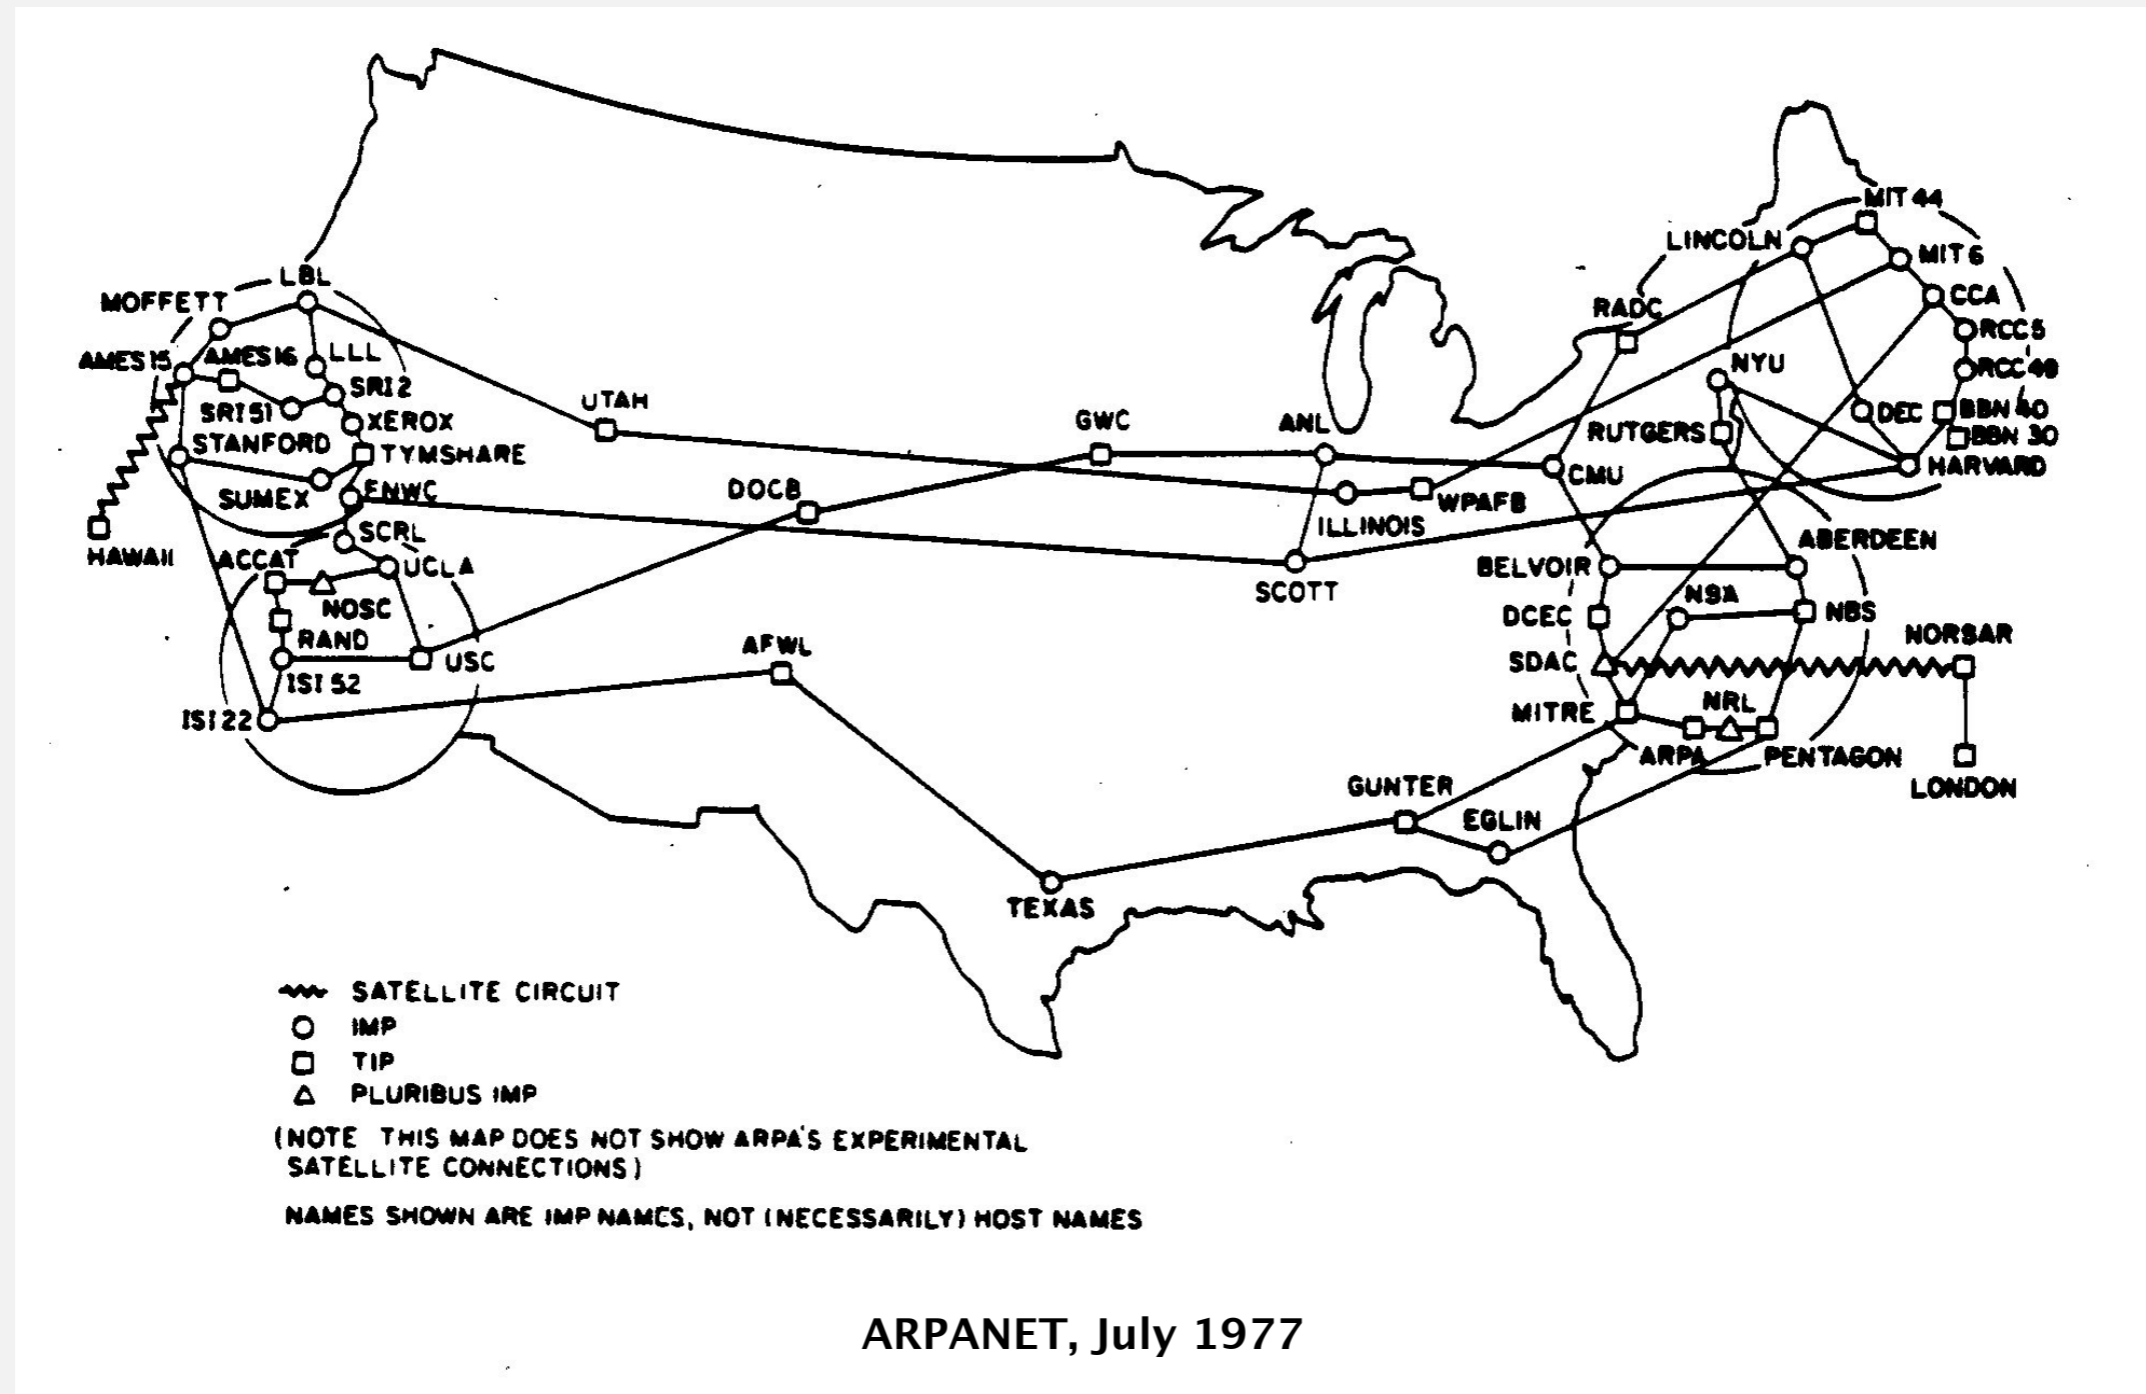

graph  $G$

# Graph-processing challenge 1

---

**Problem.** Identify connected components.

**How difficult?**

- A.** Any programmer could do it.
- B.** Diligent algorithms student could do it.
- C.** Hire an expert.
- D.** Intractable.
- E.** No one knows.

# Graph-processing challenge 1

---

**Problem.** Identify connected components.

**Particle detection.** Given grayscale image of particles, identify “blobs.”

- Vertex: pixel.
- Edge: between two adjacent pixels with grayscale value  $\geq 70$ .
- Blob: connected component of 20–30 pixels.

# Graph-processing challenge 2

**Problem.** Is a graph bipartite?

**How difficult?**

- A.** Any programmer could do it.
- B.** Diligent algorithms student could do it.
- C.** Hire an expert.
- D.** Intractable.
- E.** No one knows.

# Graph-processing challenge 3

---

**Problem.** Find a cycle in a graph (if one exists).

**How difficult?**

- A.** Any programmer could do it.
- B.** Diligent algorithms student could do it.
- C.** Hire an expert.
- D.** Intractable.
- E.** No one knows.

# Graph-processing challenge 4

---

**Problem.** Is there a (general) cycle that uses every edge exactly once?

**How difficult?**

- A.** Any programmer could do it.
- B.** Diligent algorithms student could do it.
- C.** Hire an expert.
- D.** Intractable.
- E.** No one knows.

0-1-2-3-4-2-0-6-4-5-0

# Graph-processing challenge 5

---

**Problem.** Is there a cycle that contains every vertex exactly once?

**How difficult?**

- A.** Any programmer could do it.
- B.** Diligent algorithms student could do it.
- C.** Hire an expert.
- D.** Intractable.
- E.** No one knows.

# Graph-processing challenge 6

**Problem.** Are two graphs identical except for vertex names?

**How difficult?**

- A.** Any programmer could do it.
- B.** Diligent algorithms student could do it.
- C.** Hire an expert.
- D.** Intractable.
- E.** No one knows.

$0 \leftrightarrow 4, 1 \leftrightarrow 3, 2 \leftrightarrow 2, 3 \leftrightarrow 6, 4 \leftrightarrow 5, 5 \leftrightarrow 0, 6 \leftrightarrow 1$

# Graph-processing challenge 7

---

**Problem.** Can you draw a graph in the plane with no crossing edges?

try it yourself at <http://planarity.net>

**How difficult?**

- A.** Any programmer could do it.
- B.** Diligent algorithms student could do it.
- C.** Hire an expert.
- D.** Intractable.
- E.** No one knows

# Graph traversal summary

---

BFS and DFS enables efficient solution of many (but not all) graph problems.

graph problem	BFS	DFS	time
s-t path	✓	✓	$E + V$
shortest s-t path	✓		$E + V$
cycle	✓	✓	$E + V$
Euler cycle		✓	$E + V$
Hamilton cycle			$2^{1.657 V}$
bipartiteness (odd cycle)	✓	✓	$E + V$
connected components	✓	✓	$E + V$
biconnected components		✓	$E + V$
planarity		✓	$E + V$
graph isomorphism			$2^{c \ln^3 V}$
