# Spanning tree

---

**Def.** A **spanning tree** of  $G$  is a subgraph  $T$  that is:

- A tree: connected and acyclic.
- Spanning: includes all of the vertices.

graph  $G$

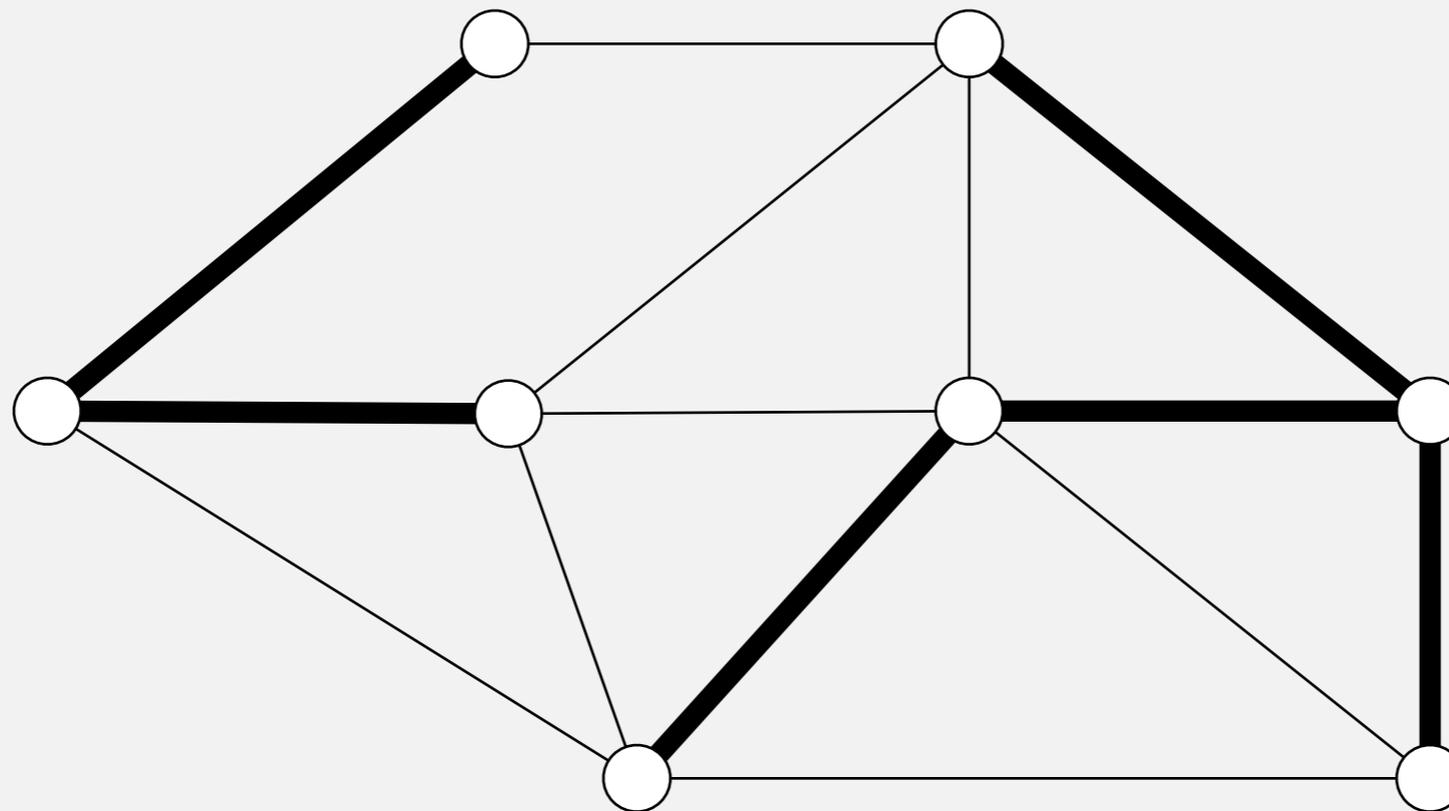

spanning tree  $T$

# Spanning tree

---

**Def.** A **spanning tree** of  $G$  is a subgraph  $T$  that is:

- A tree: connected and acyclic.
- Spanning: includes all of the vertices.

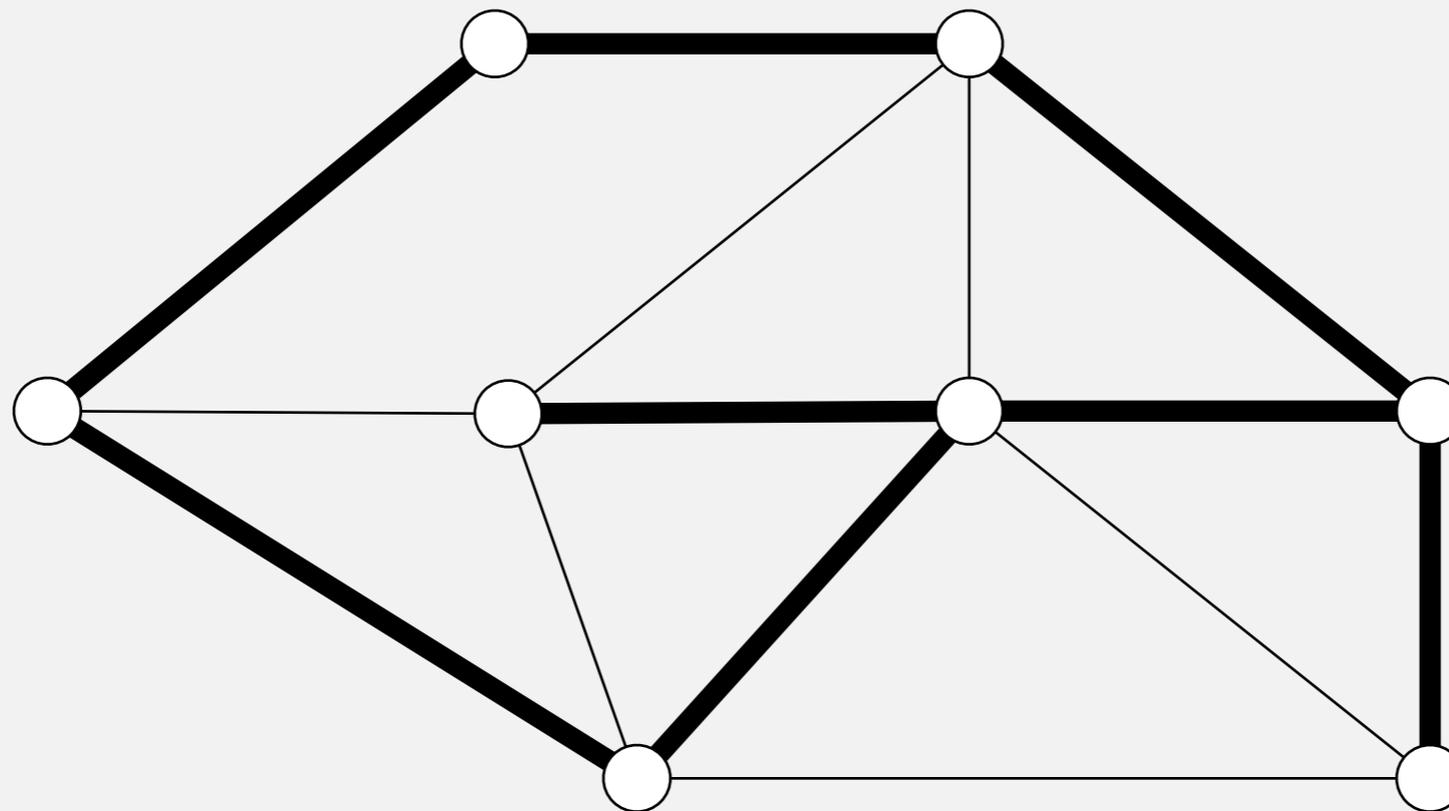

**not connected**

# Spanning tree

---

**Def.** A **spanning tree** of  $G$  is a subgraph  $T$  that is:

- A tree: connected and acyclic.
- Spanning: includes all of the vertices.

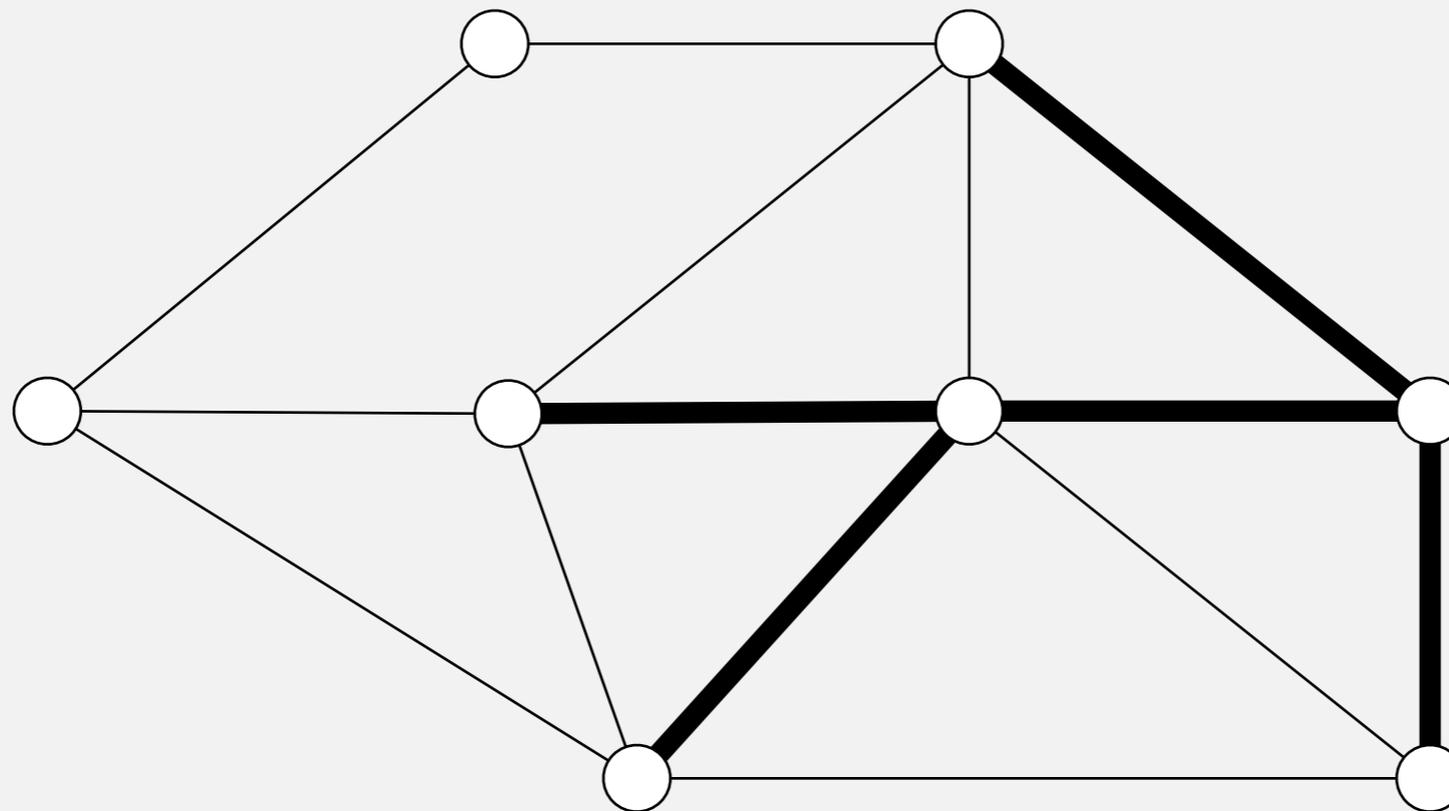

not a tree (cyclic)

# Spanning tree

---

**Def.** A **spanning tree** of  $G$  is a subgraph  $T$  that is:

- A tree: connected and acyclic.
- Spanning: includes all of the vertices.

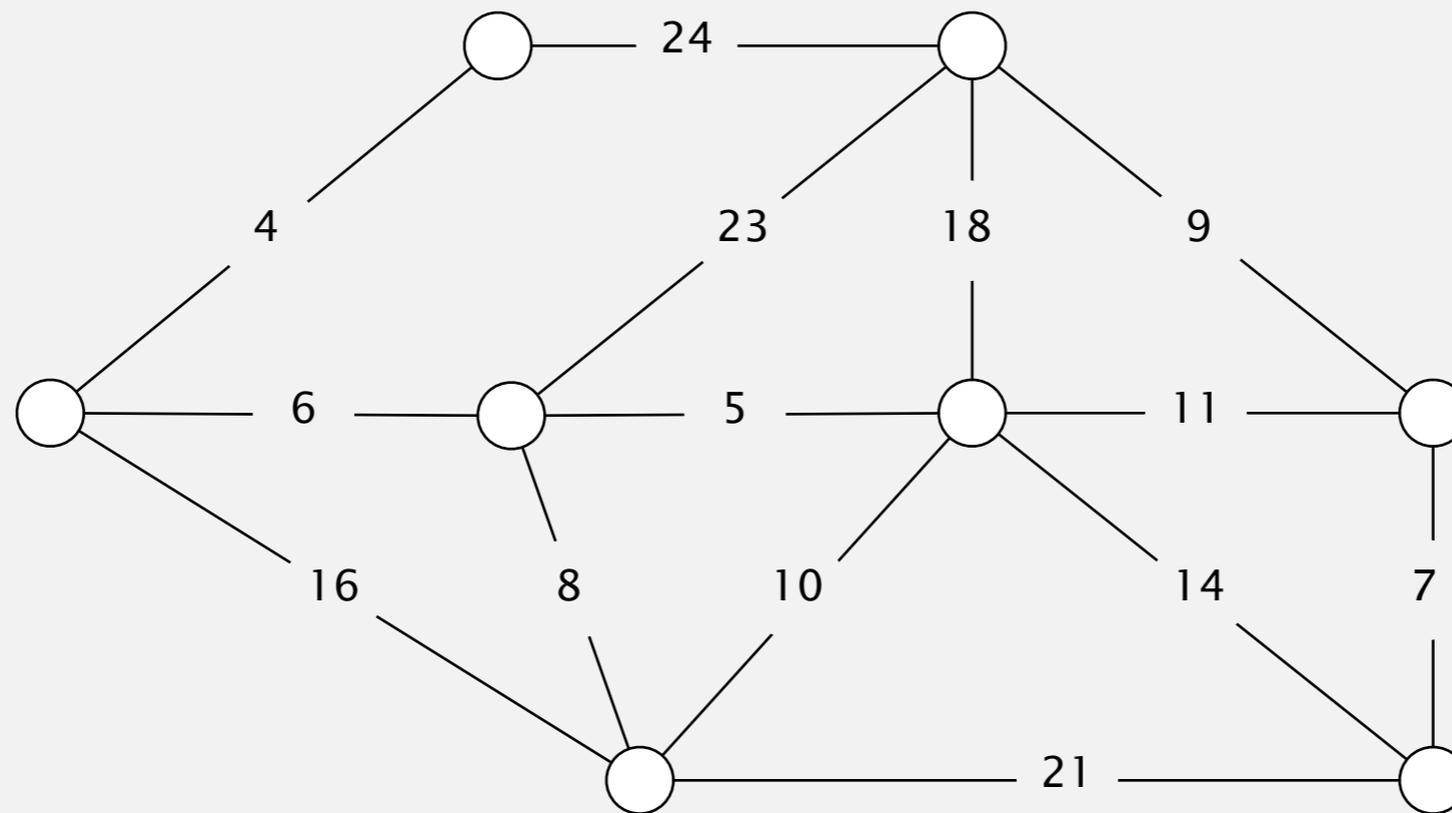

**not spanning**

# Minimum spanning tree problem

---

**Input.** Connected, undirected graph  $G$  with positive edge weights.

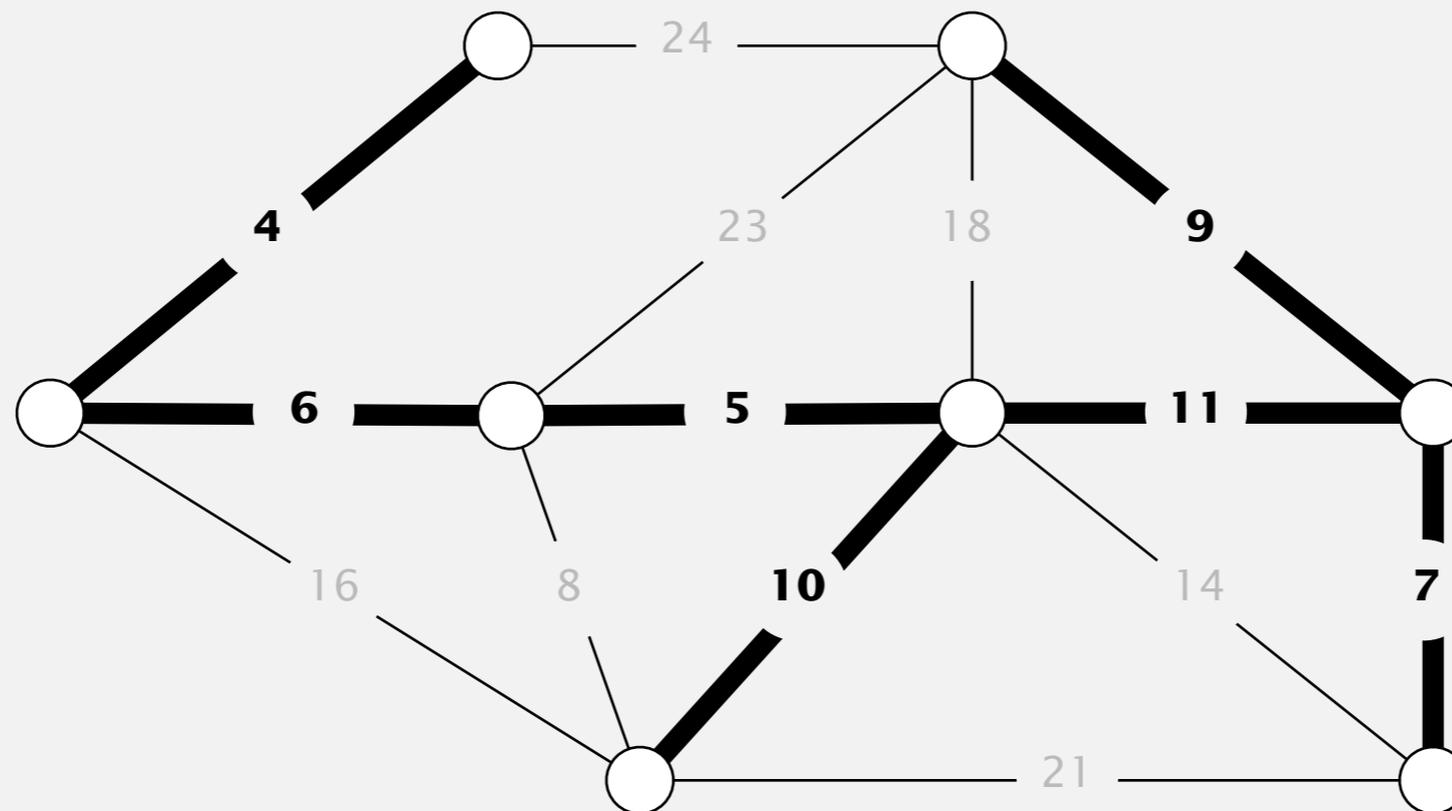

**edge-weighted digraph  $G$**

# Minimum spanning tree problem

---

**Input.** Connected, undirected graph  $G$  with positive edge weights.

**Output.** A spanning tree of minimum weight.

**minimum spanning tree T**  
(weight = 50 = 4 + 6 + 8 + 5 + 11 + 9 + 7)

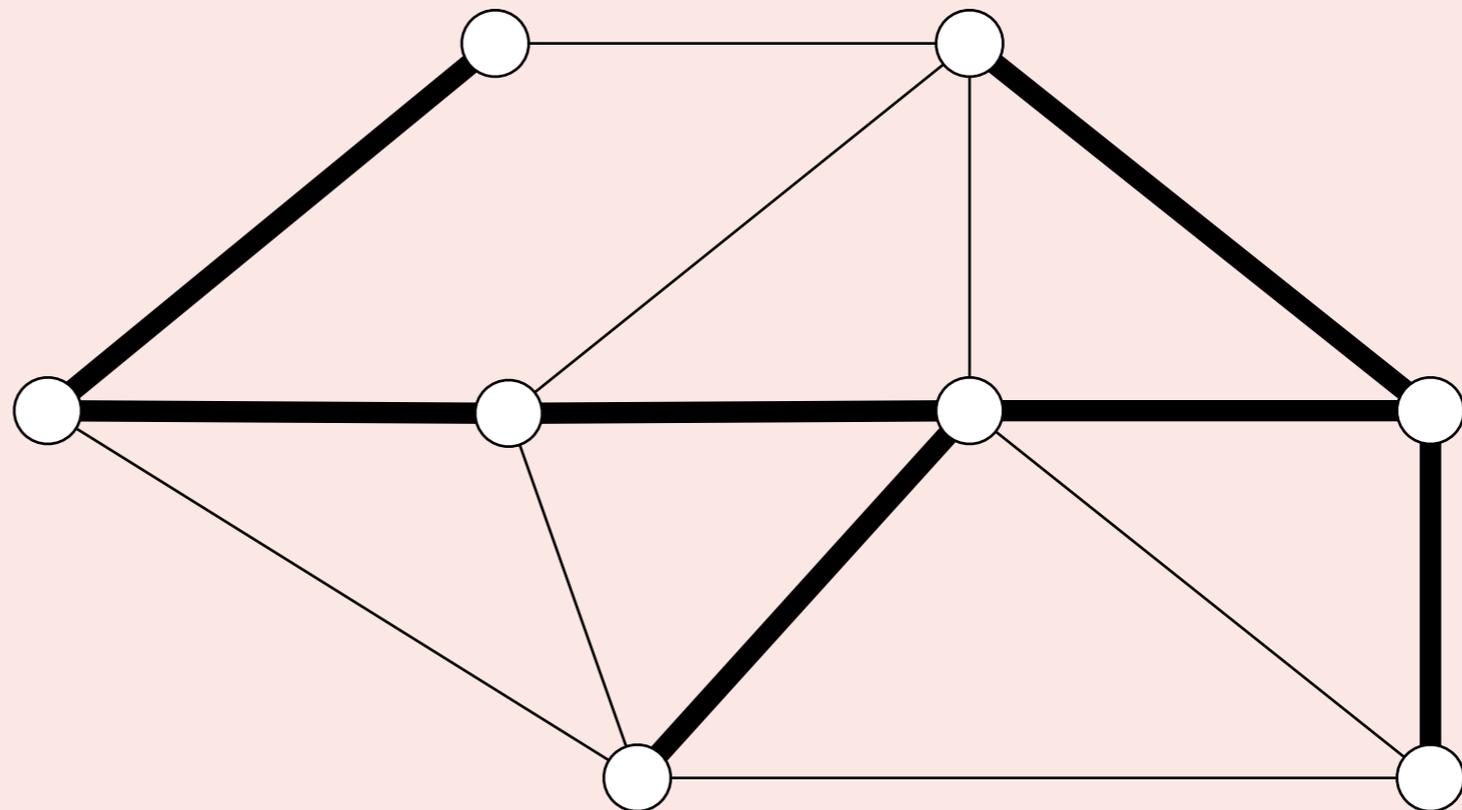

**Brute force.** Try all spanning trees?

# Minimum spanning trees: quiz 1

---

Let  $T$  be a spanning tree of a connected graph  $G$  with  $V$  vertices.  
Which of the following statements are true?

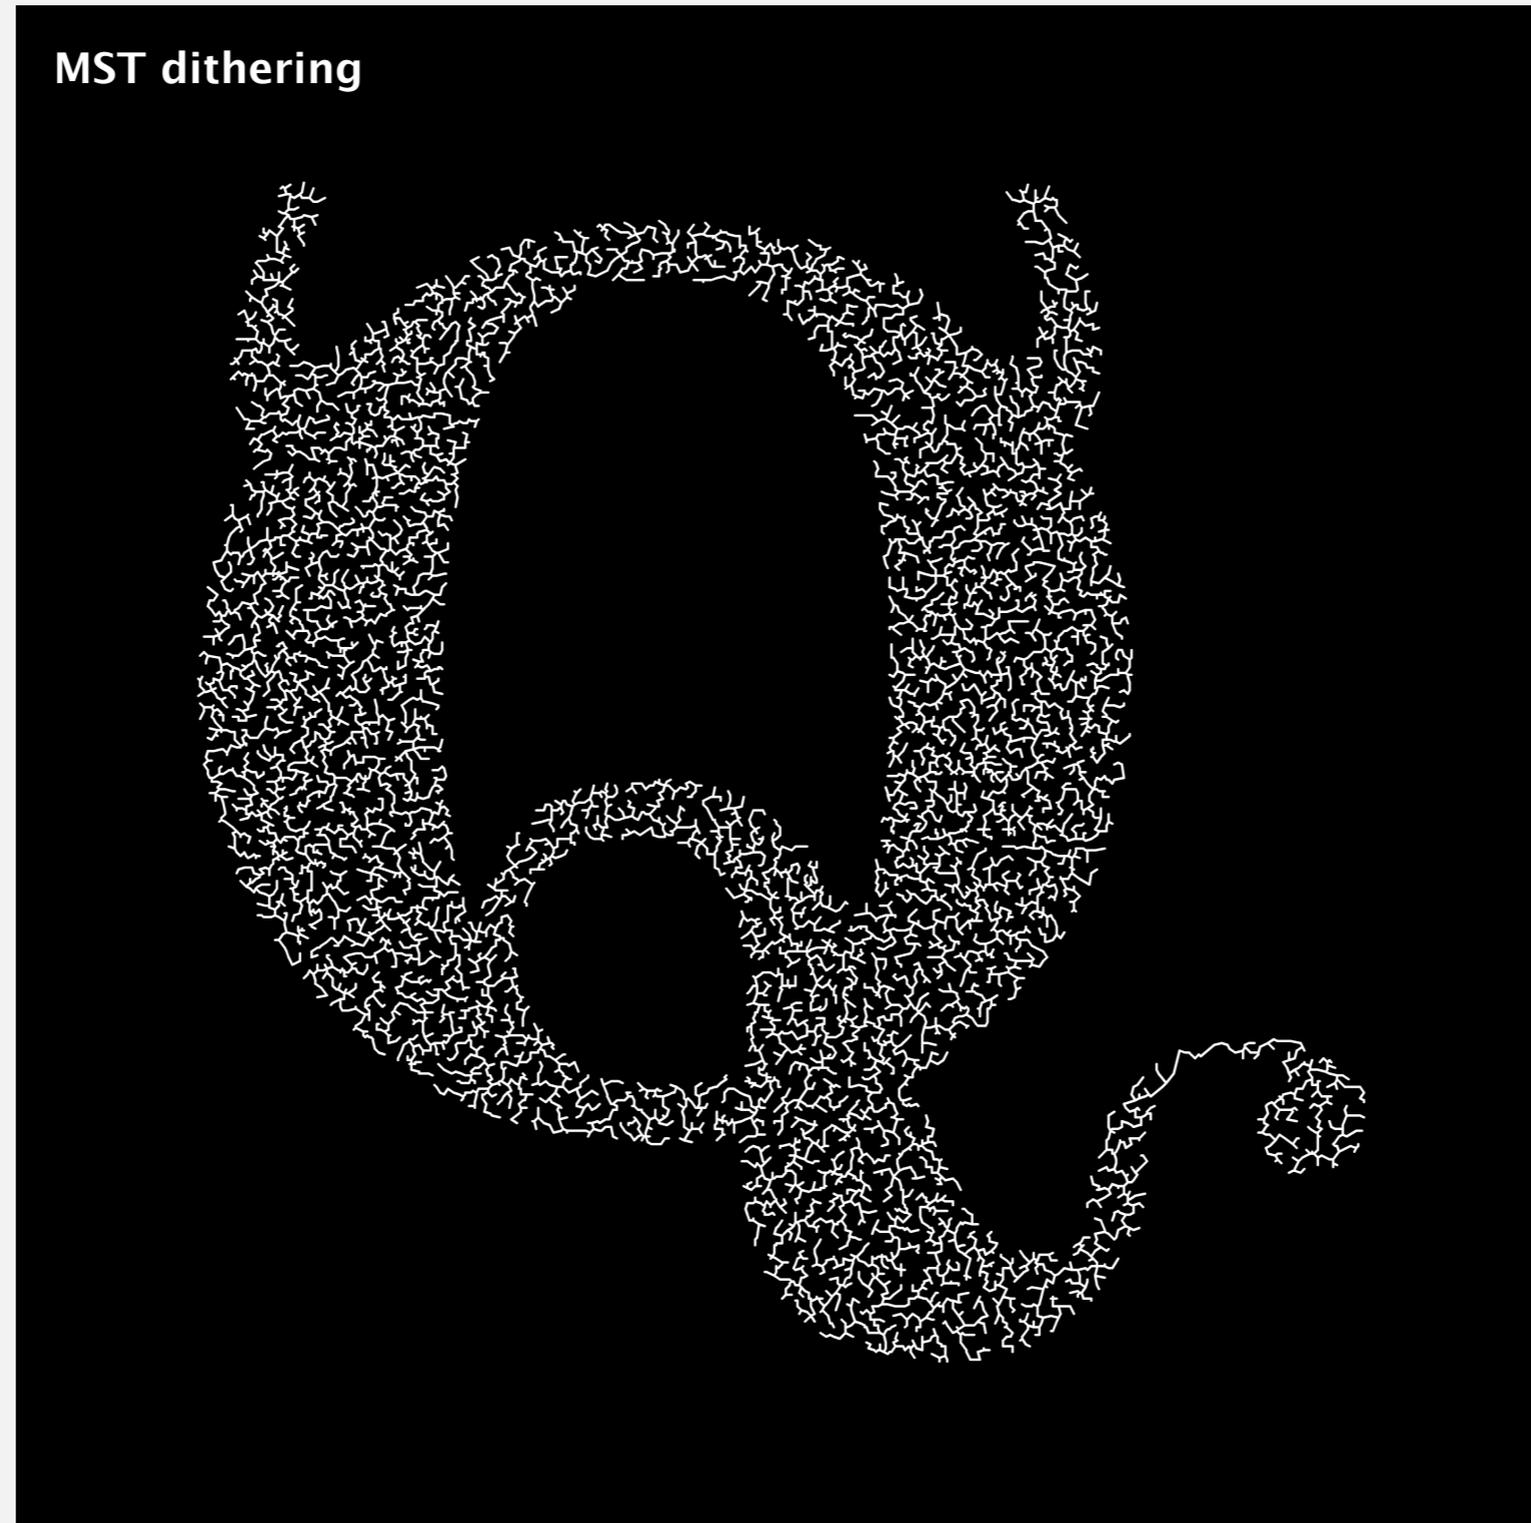

- A.  $T$  contains exactly  $V - 1$  edges.
- B. Removing any edge from  $T$  disconnects it.
- C. Adding any edge to  $T$  creates a cycle.
- D. All of the above.

spanning tree  $T$  of graph  $G$

<https://www.youtube.com/watch?v=GwKuFREOgmo>

# Applications

---

MST is fundamental problem with diverse applications.

- Dithering.
- Cluster analysis.
- Max bottleneck paths.
- Real-time face verification.
- LDPC codes for error correction.
- Image registration with Renyi entropy.
- Find road networks in satellite and aerial imagery.
- Reducing data storage in sequencing amino acids in a protein.
- Model locality of particle interactions in turbulent fluid flows.
- Autoconfig protocol for Ethernet bridging to avoid cycles in a network.
- Network design (communication, electrical, hydraulic, computer, road).
- Approximation algorithms for **NP**-hard problems (e.g., TSP, Steiner tree).

# Simplifying assumptions

---

For simplicity, we assume:

- The graph is connected.  $\Rightarrow$  MST exists.
- The edge weights are distinct.  $\Rightarrow$  MST is unique.  $\longleftarrow$  see Exercise 4.3.3

**Note.** Algorithms still work correctly even if duplicate edge weights.

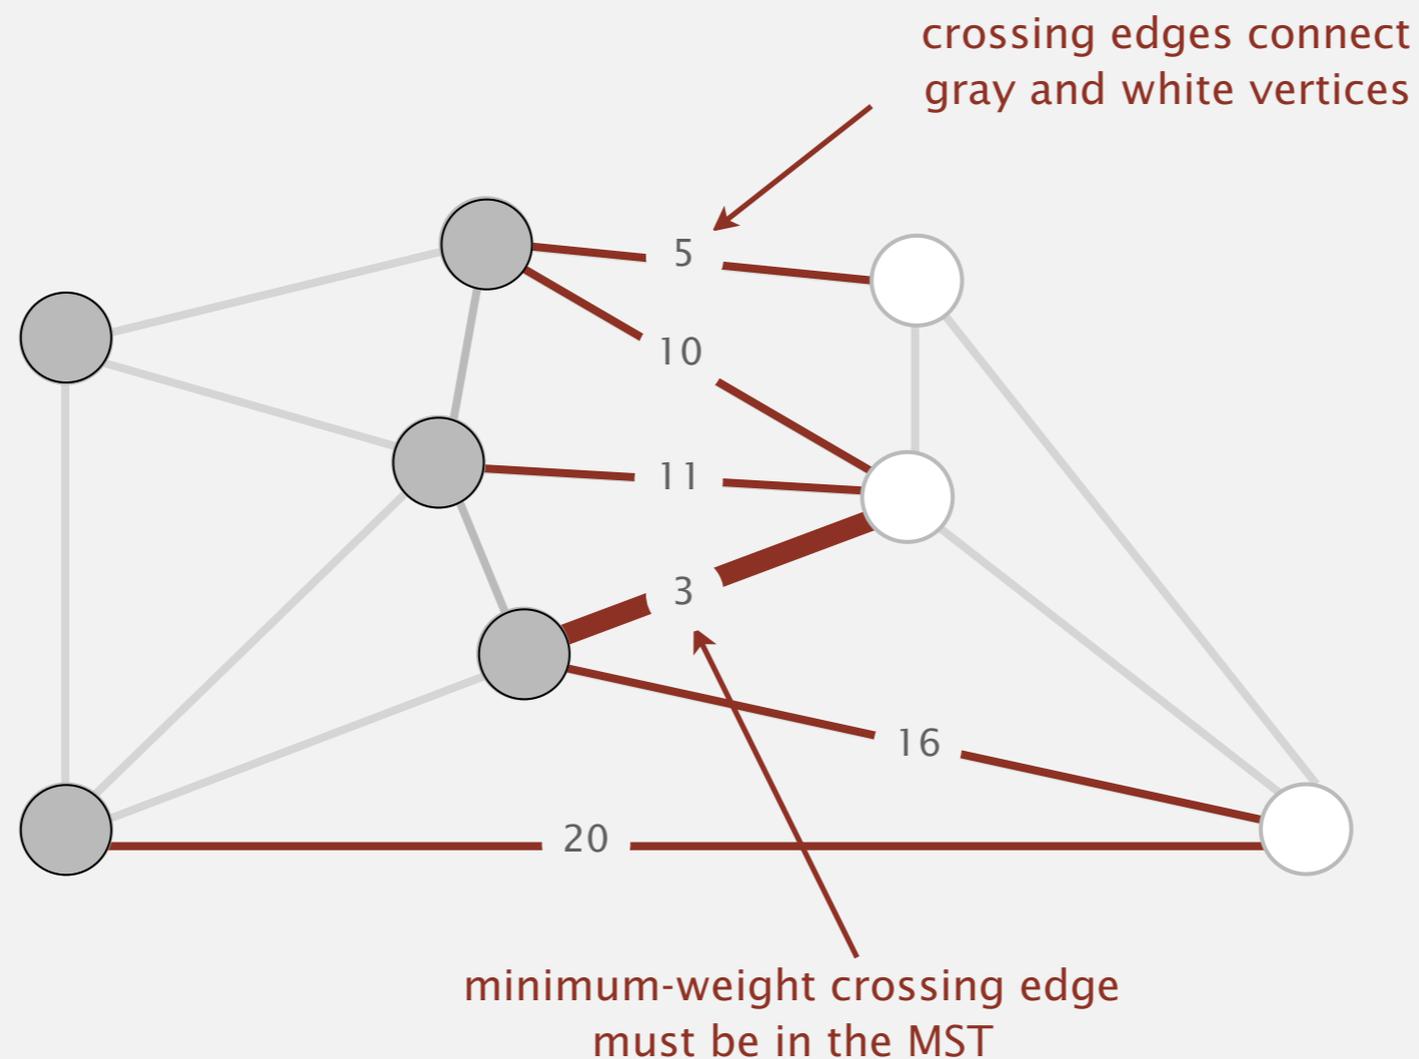

# Cut property

---

**Def.** A **cut** in a graph is a partition of its vertices into two (nonempty) sets.

**Def.** A **crossing edge** connects a vertex in one set with a vertex in the other.

**Cut property.** Given any cut, the crossing edge of min weight is in the MST.

# Minimum spanning trees: quiz 2

---

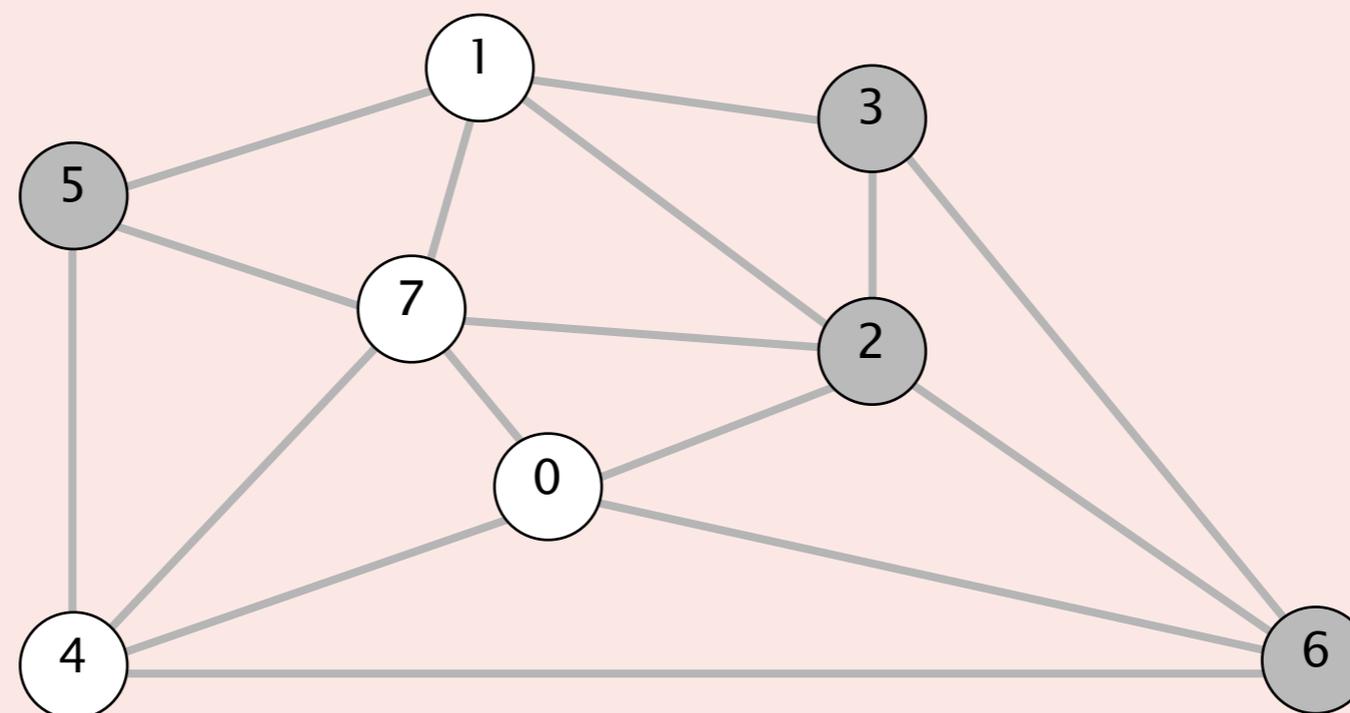

Which is the min weight edge crossing the cut  $\{2, 3, 5, 6\}$ ?

A. 0–7 (0.16)

B. 2–3 (0.17)

C. 0–2 (0.26)

D. 5–7 (0.28)

0–7	0.16
2–3	0.17
1–7	0.19
0–2	0.26
5–7	0.28
1–3	0.29
1–5	0.32
2–7	0.34
4–5	0.35

6–0	0.58
6–4	0.93

# Cut property: correctness proof

---

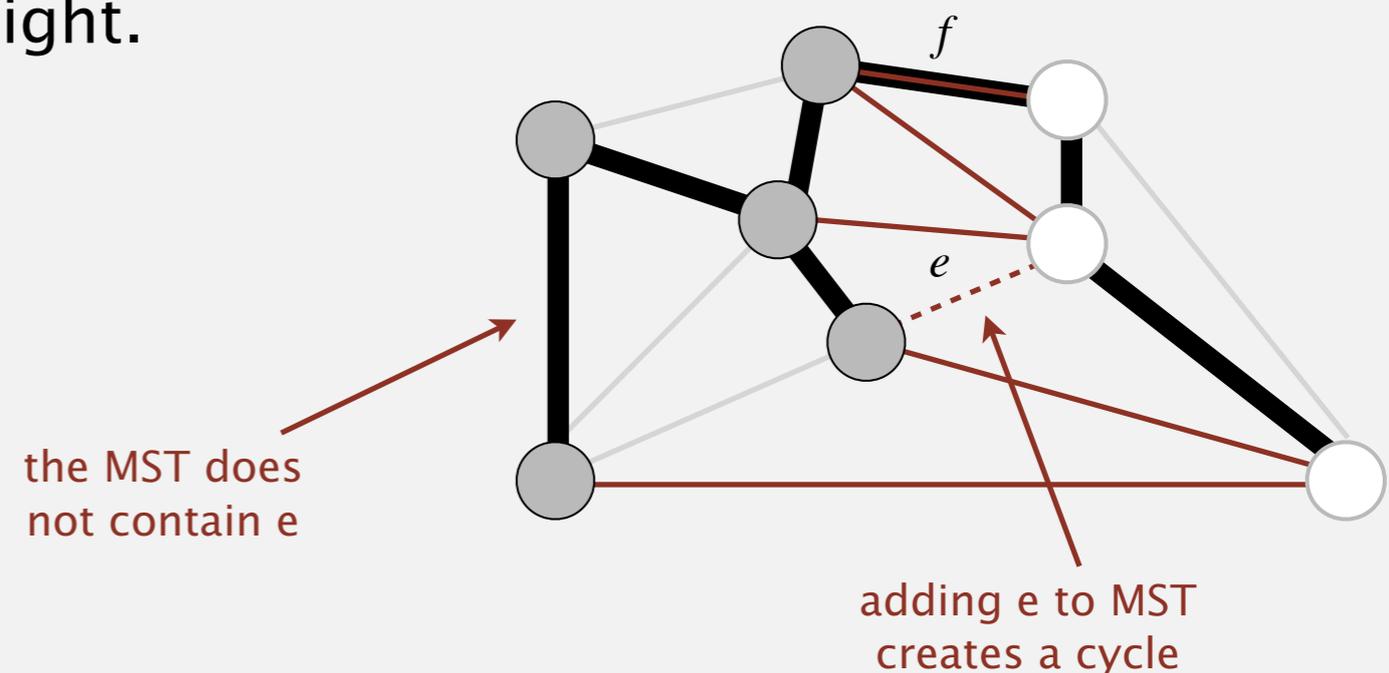

**Def.** A **cut** is a partition of a graph's vertices into two (nonempty) sets.

**Def.** A **crossing edge** connects two vertices in different sets.

**Cut property.** Given any cut, the min-weight crossing edge  $e$  is in the MST.

**Pf.** Suppose  $e$  is not in the MST.

- Adding  $e$  to the MST creates a cycle.
- Some other edge  $f$  in cycle must be a crossing edge.
- Removing  $f$  and adding  $e$  is also a spanning tree.
- Since weight of  $e$  is less than the weight of  $f$ , that spanning tree has lower weight.
- Contradiction. ■

# Weighted edge API

---

Edge abstraction needed for weighted edges.

```
public class Edge implements Comparable<Edge>
```

```
    Edge(int v, int w, double weight)
```

*create a weighted edge v-w*

```
    int either()
```

*either endpoint*

```
    int other(int v)
```

*the endpoint that's not v*

```
    int compareTo(Edge that)
```

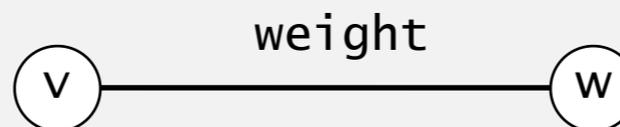

*compare this edge to that edge*

```
    double weight()
```

*the weight*

```
    String toString()
```

*string representation*

Idiom for processing an edge `e`: `int v = e.either(), w = e.other(v);`

# Weighted edge: Java implementation

---

```
public class Edge implements Comparable<Edge>
{
    private final int v, w;
    private final double weight;
```

```
    public Edge(int v, int w, double weight)
    {
        this.v = v;
        this.w = w;
        this.weight = weight;
    }
```

← constructor

```
    public int either()
    { return v; }
```

← either endpoint

```
    public int other(int vertex)
    {
        if (vertex == v) return w;
        else return v;
    }
```

← other endpoint

```
    public int compareTo(Edge that)
    {
        if (this.weight < that.weight) return -1;
        else if (this.weight > that.weight) return +1;
        else return 0;
    }
}
```

← compare edges by weight

# Edge-weighted graph API

---

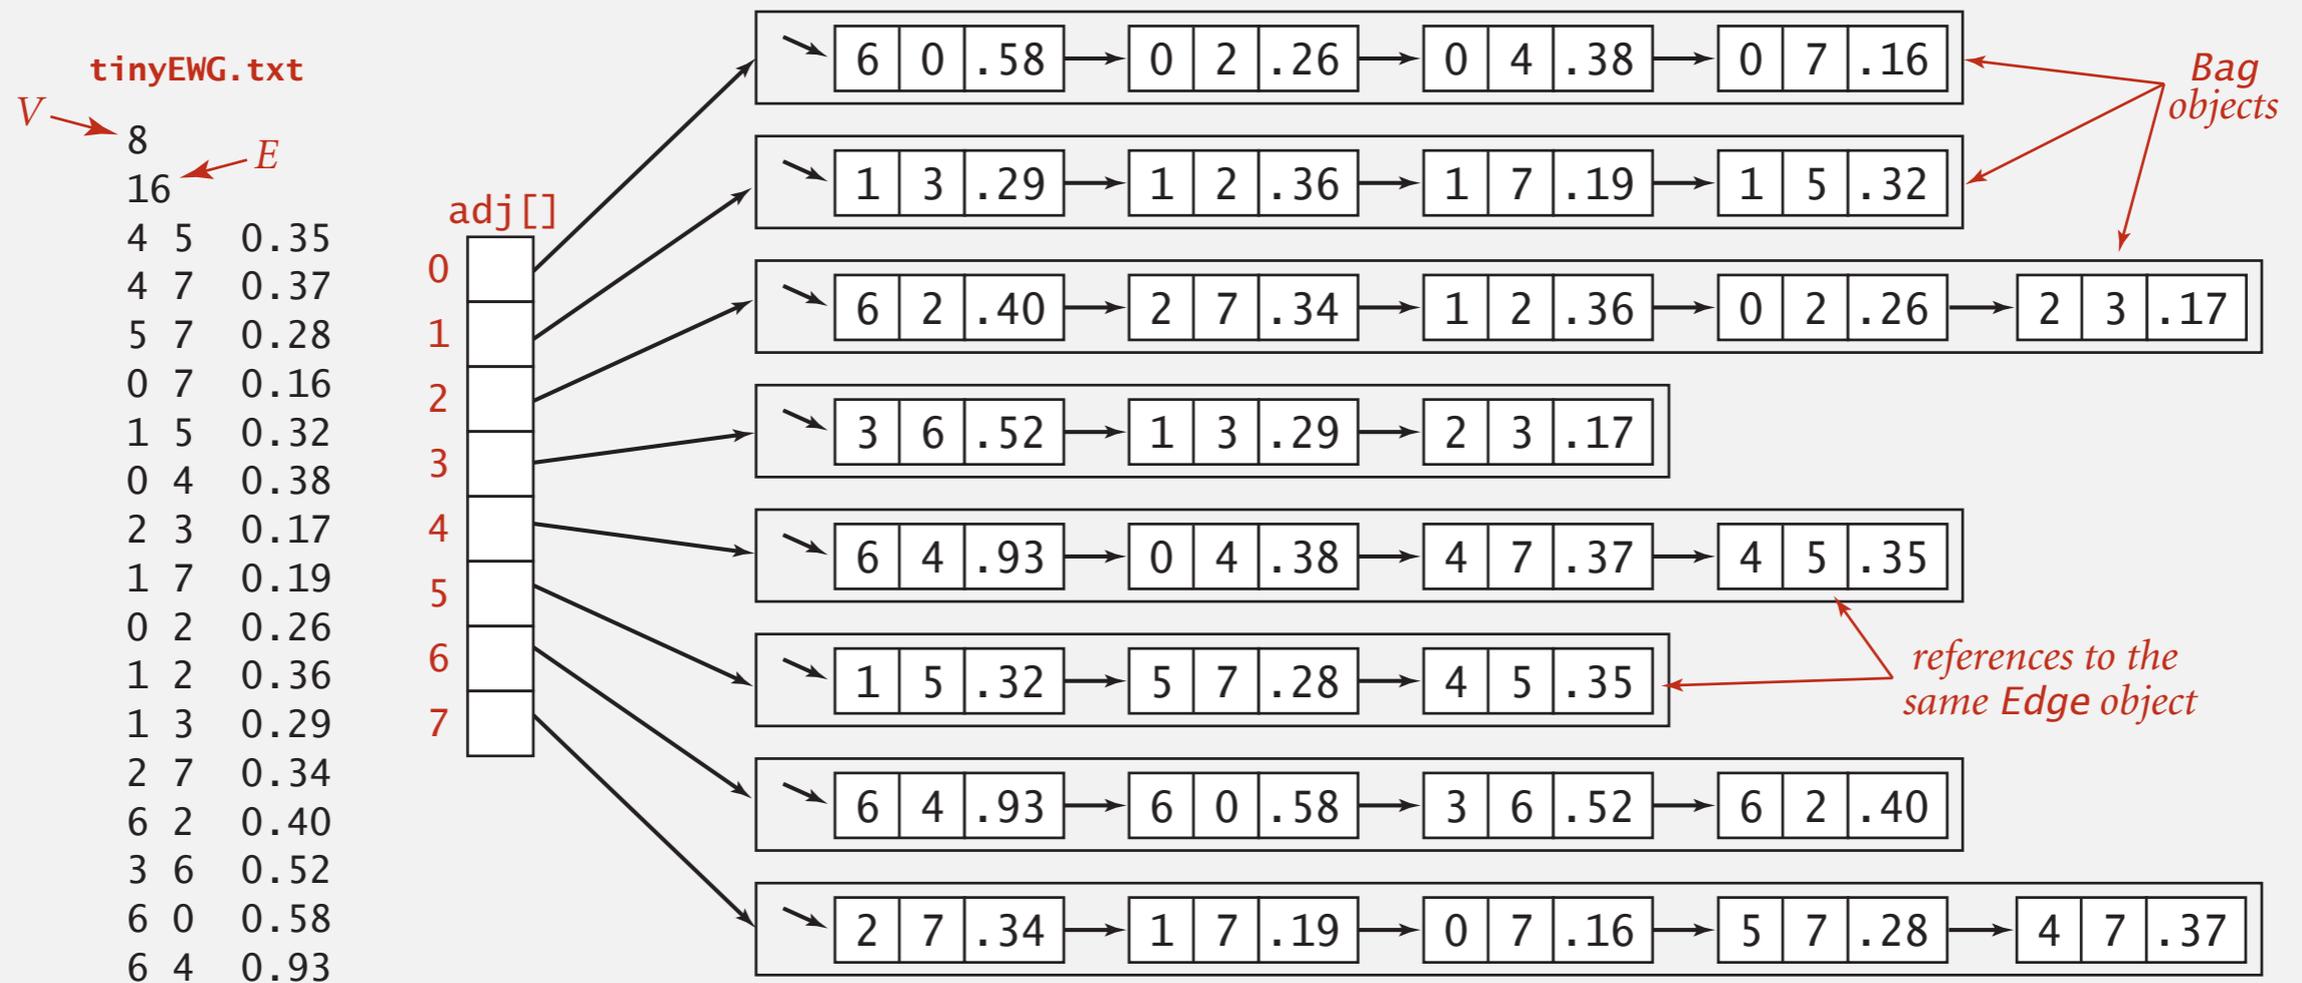

```
public class EdgeWeightedGraph
```

<code>EdgeWeightedGraph(int V)</code>	<i>create an empty graph with V vertices</i>
<code>EdgeWeightedGraph(In in)</code>	<i>create a graph from input stream</i>
<code>void addEdge(Edge e)</code>	<i>add weighted edge e to this graph</i>
<code>Iterable&lt;Edge&gt; adj(int v)</code>	<i>edges incident to v</i>
<code>Iterable&lt;Edge&gt; edges()</code>	<i>all edges in this graph</i>
<code>int V()</code>	<i>number of vertices</i>
<code>int E()</code>	<i>number of edges</i>
<code>String toString()</code>	<i>string representation</i>

**Conventions.** Allow self-loops and parallel edges.

# Edge-weighted graph: adjacency-lists representation

Maintain vertex-indexed array of Edge lists.

# Edge-weighted graph: adjacency-lists implementation

---

```
public class EdgeWeightedGraph
{
    private final int V;
    private final Bag<Edge>[] adj;
```

← same as Graph, but adjacency lists of Edges instead of integers

```
public EdgeWeightedGraph(int V)
{
    this.V = V;
    adj = (Bag<Edge>[]) new Bag[V];
    for (int v = 0; v < V; v++)
        adj[v] = new Bag<Edge>();
}
```

← constructor

```
public void addEdge(Edge e)
{
    int v = e.either(), w = e.other(v);
    adj[v].add(e);
    adj[w].add(e);
}
```

← add edge to both adjacency lists

```
public Iterable<Edge> adj(int v)
{ return adj[v]; }
}
```

# Minimum spanning tree API

---

Q. How to represent the MST?

```
public class MST
```

```
    MST(EdgeWeightedGraph G)
```

*constructor*

```
    Iterable<Edge> edges()
```

*edges in MST*

```
    double weight()
```

*weight of MST*

# Kruskal's algorithm: visualization

---

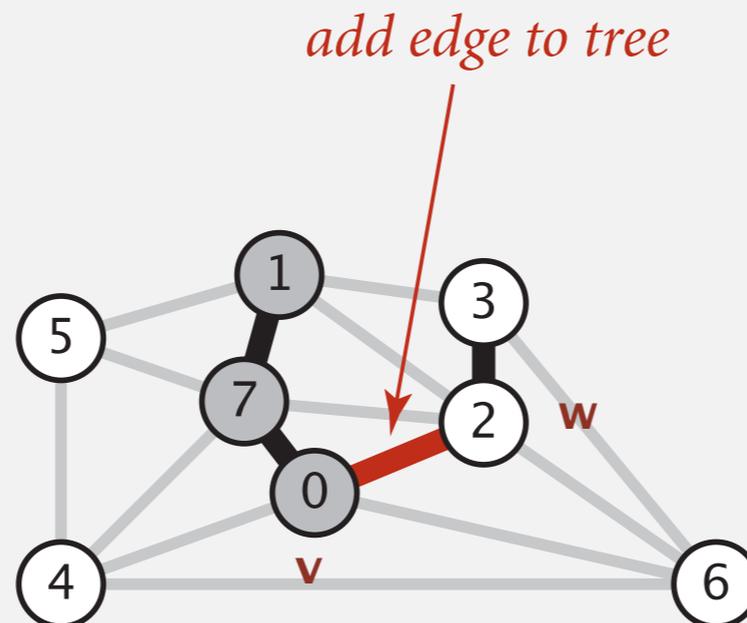

# Kruskal's algorithm: correctness proof

---

**Proposition.** [Kruskal 1956] Kruskal's algorithm computes the MST.

**Pf.** [Case 1] Kruskal's algorithm adds edge  $e = v-w$  to  $T$ .

- Vertices  $v$  and  $w$  are in different connected components of  $T$ .
- Cut = set of vertices connected to  $v$  in  $T$ .
- By construction of cut, no edge crossing cut is in  $T$ .
- No edge crossing cut has lower weight. Why?
- Cut property  $\Rightarrow$  edge  $e$  is in the MST.

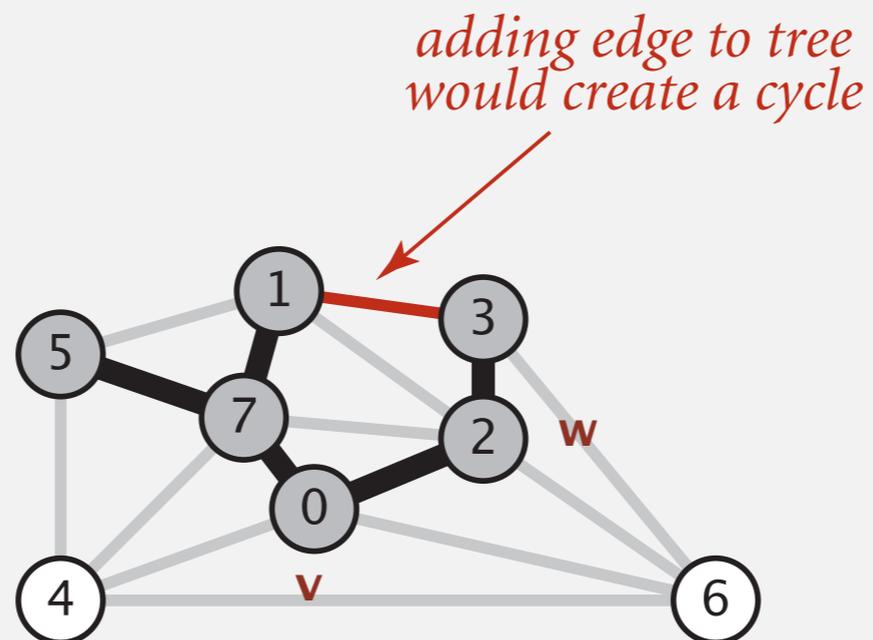

# Kruskal's algorithm: correctness proof

---

**Proposition.** [Kruskal 1956] Kruskal's algorithm computes the MST.

**Pf.** [Case 2] Kruskal's algorithm discards edge  $e = v-w$ .

- From Case 1, all edges in  $T$  are in the MST.
- The MST can't contain a cycle. ■

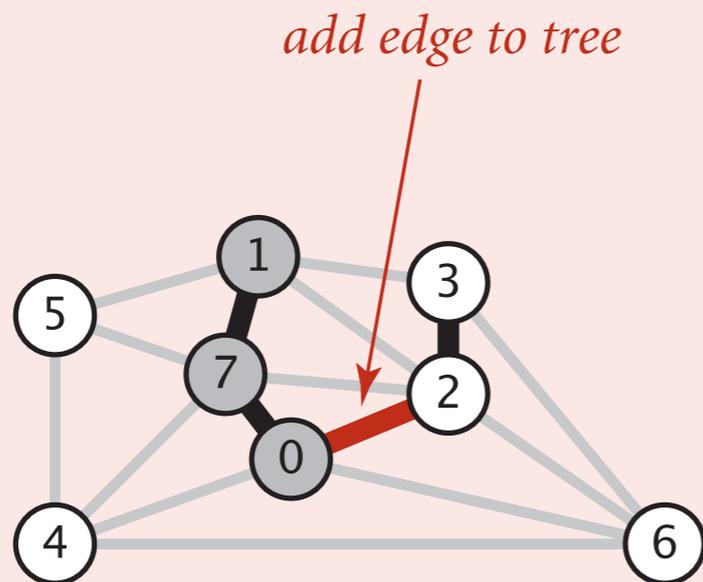

# Kruskal's algorithm: implementation challenge

---

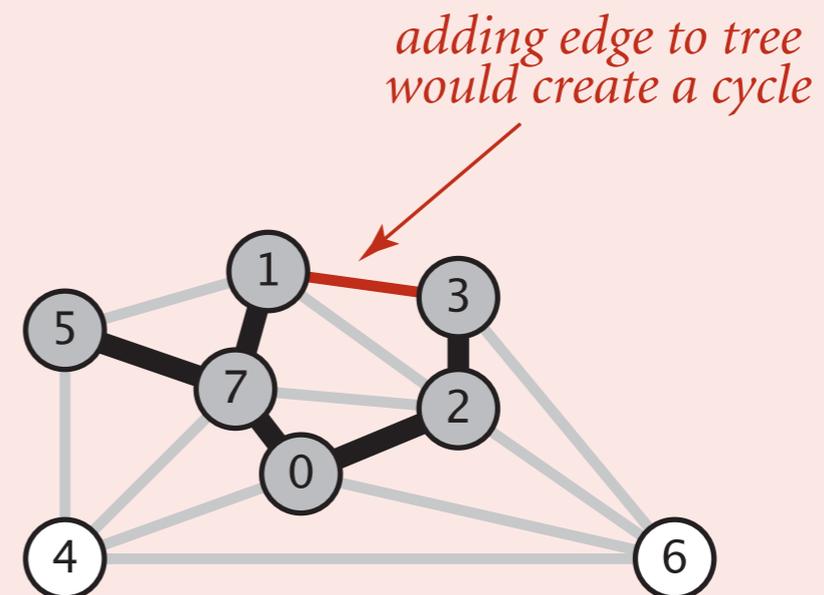

**Challenge.** Would adding edge  $v-w$  to tree  $T$  create a cycle? If not, add it.

**How difficult to implement?**

- A. 1
- B.  $\log V$
- C.  $V$
- D.  $E + V$

Case 1:  $v$  and  $w$  in same component

Case 2:  $v$  and  $w$  in different components

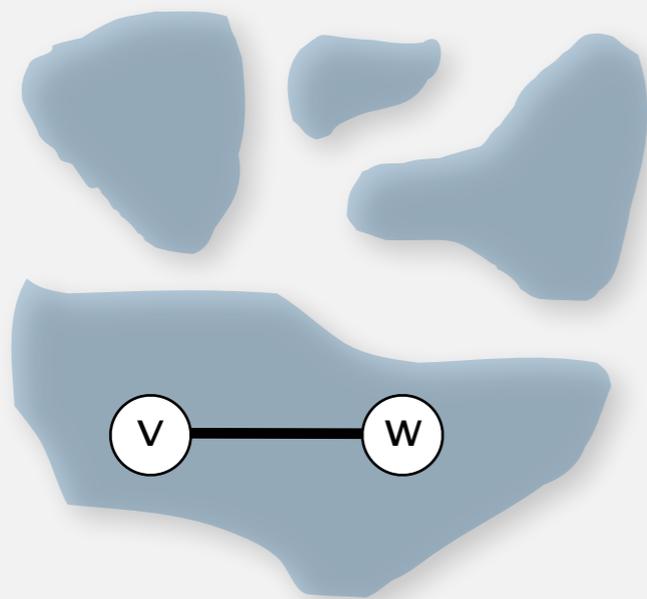

# Kruskal's algorithm: implementation challenge

---

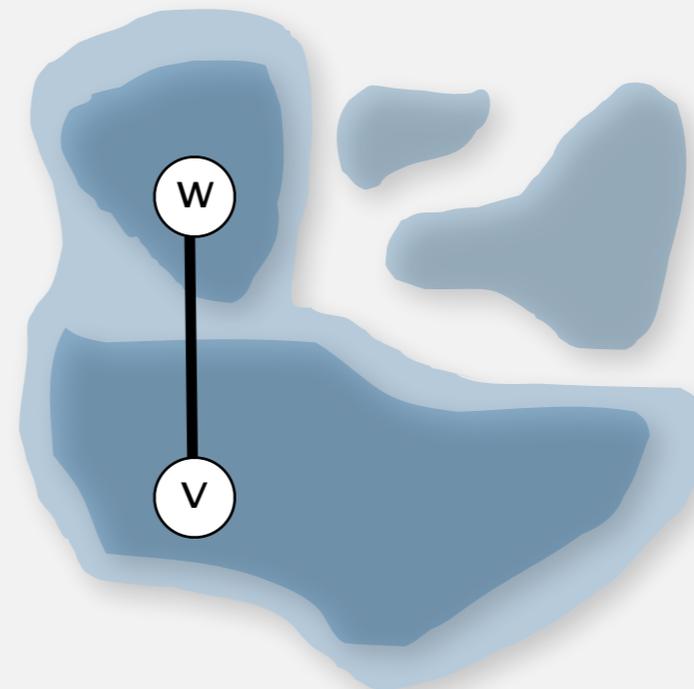

**Challenge.** Would adding edge  $v-w$  to tree  $T$  create a cycle? If not, add it.

**Efficient solution.** Use the **union-find** data structure.

- Maintain a set for each connected component in  $T$ .
- If  $v$  and  $w$  are in same set, then adding  $v-w$  would create a cycle.
- To add  $v-w$  to  $T$ , merge sets containing  $v$  and  $w$ .

Case 2: adding  $v-w$  creates a cycle

Case 1: add  $v-w$  to  $T$  and merge sets containing  $v$  and  $w$

# Kruskal's algorithm: Java implementation

---

```
public class KruskalMST
{
    private Queue<Edge> mst = new Queue<Edge>();

    public KruskalMST(EdgeWeightedGraph G)
    {
        DirectedEdge[] edges = G.edges();
        Arrays.sort(edges);
        UF uf = new UF(G.V());

        for (int i = 0; i < G.E(); i++)
        {
            Edge e = edges[i];
            int v = e.either(), w = e.other(v);
            if (uf.find(v) != uf.find(w))
            {
                uf.union(v, w);
                mst.enqueue(e);
            }
        }
    }

    public Iterable<Edge> edges()
    { return mst; }
}
```

← edges in the MST

← sort edges by weight

← maintain connected components

← greedily add edges to MST

← edge v-w does not create cycle

← merge connected components

← add edge e to MST

# Kruskal's algorithm: running time

---

**Proposition.** Kruskal's algorithm computes MST in time proportional to  $E \log E$  (in the worst case).

**Pf.**

operation	frequency	time per op
<b>SORT</b>	1	$E \log E$
<b>UNION</b>	$V - 1$	$\log V^\dagger$
<b>FIND</b>	$2E$	$\log V^\dagger$

† using weighted quick union

# Greed is good

---

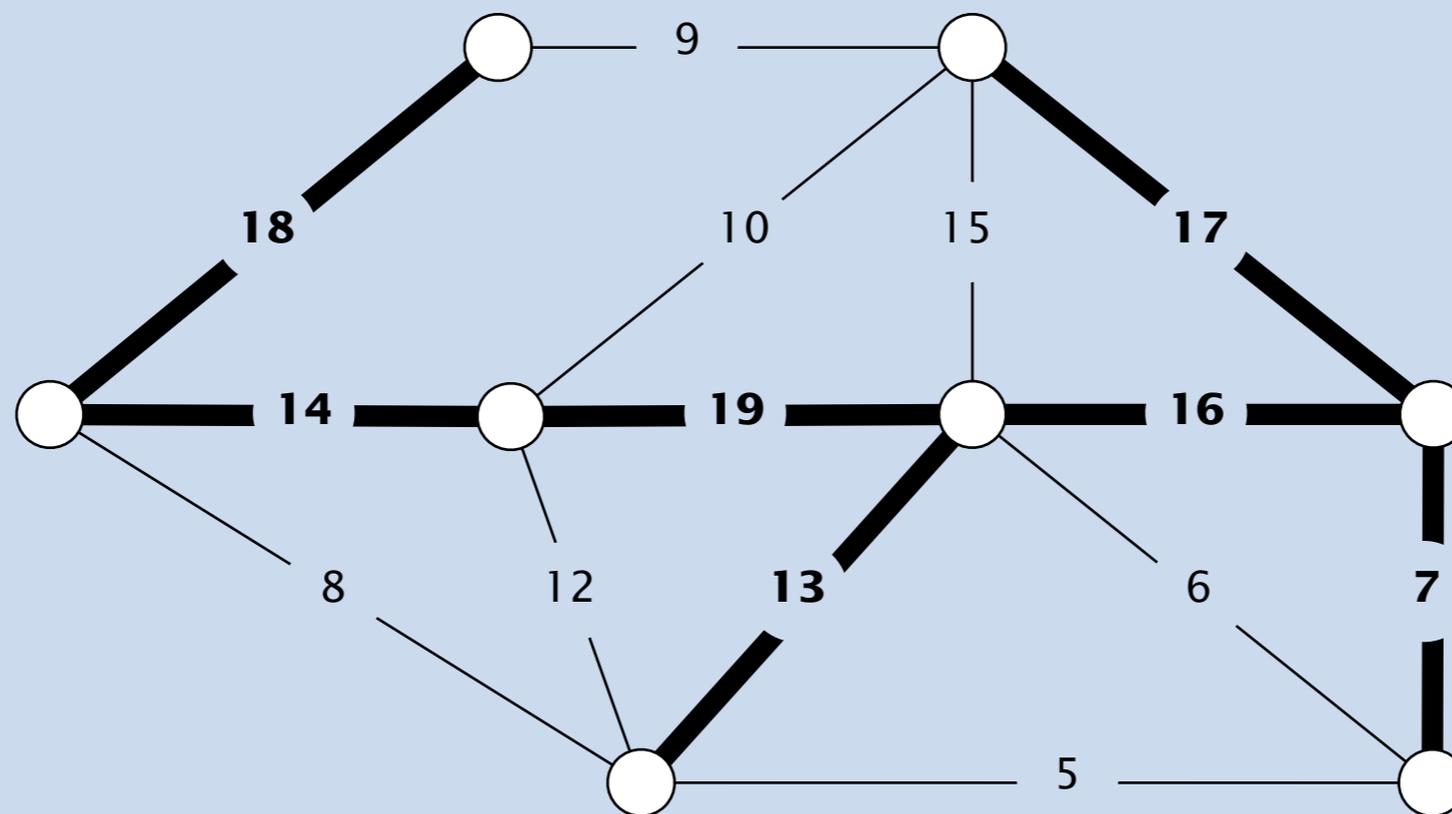

**Gordon Gecko (Michael Douglas) evangelizing the importance of greed (in algorithm design?)  
Wall Street (1986)**

# MAXIMUM SPANNING TREE

**Problem.** Given an undirected graph  $G$  with positive edge weights, find a spanning tree that **maximizes the sum** of the edge weights.

**Running time.**  $E \log E$  (or better).

maximum spanning tree T (weight = 104)

# Indexed priority queue

---

Associate an index between 0 and  $n - 1$  with each key in a priority queue.

- Insert a key associated with a given index.
- Delete a minimum key and return associated index.
- **Decrease the key** associated with a given index.

for Prim's algorithm,  
 $n = V$  and index = vertex.

```
public class IndexMinPQ<Key extends Comparable<Key>>
```

```
    IndexMinPQ(int n)
```

*create indexed PQ with indices 0, 1, ..., n - 1*

```
    void insert(int i, Key key)
```

*associate key with index i*

```
    int delMin()
```

*remove a minimal key and return its associated index*

```
    void decreaseKey(int i, Key key)
```

*decrease the key associated with index i*

```
    boolean contains(int i)
```

*is i an index on the priority queue?*

```
    boolean isEmpty()
```

*is the priority queue empty?*

```
    int size()
```

*number of keys in the priority queue*

# Indexed priority queue: implementation

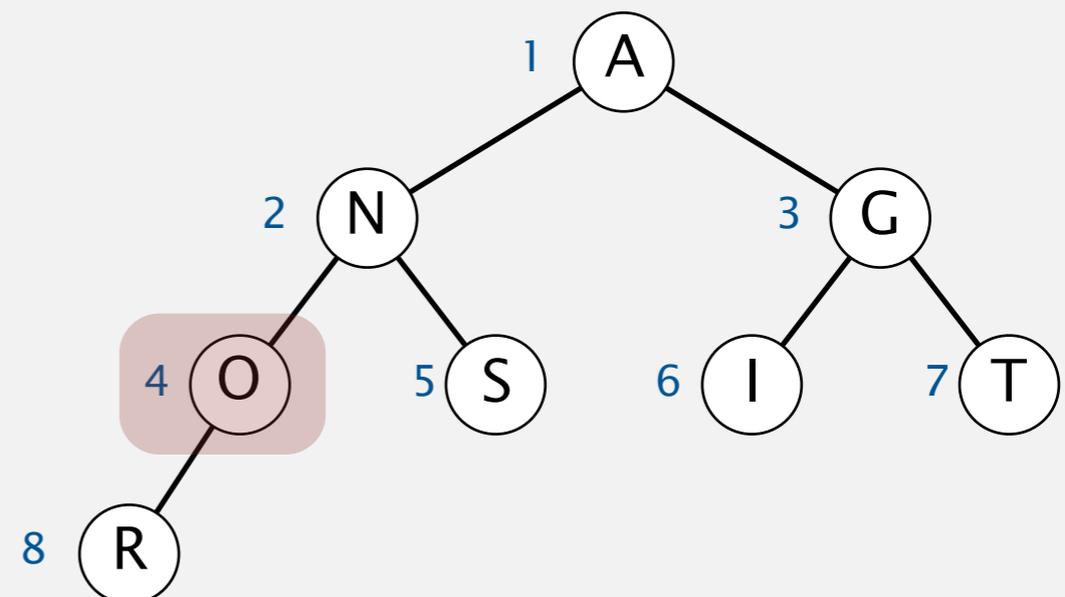

Binary heap implementation. [see Section 2.4 of textbook]

- Start with same code as MinPQ.
- Maintain parallel arrays so that:
  - $keys[i]$  is the priority of vertex  $i$
  - $qp[i]$  is the heap position of vertex  $i$
  - $pq[i]$  is the index of the key in heap position  $i$
- Use  $swim(qp[i])$  to implement  $decreaseKey(i, key)$ .

$i$	0	1	2	3	4	5	6	7	8
$keys[i]$	A	S	0	R	T	I	N	G	-
$qp[i]$	1	5	4	8	7	6	2	3	-
$pq[i]$	-	0	6	7	2	1	5	4	3

vertex 2 is at  
heap index 4

decrease key of vertex 2 to C

# Prim's algorithm: which priority queue?

---

Depends on PQ implementation:  $V$  INSERT,  $V$  DELETE-MIN,  $E$  DECREASE-KEY.

PQ implementation	INSERT	INSERT-MIN	DECREASE-KEY	total
unordered array	1	$V$	1	$V^2$
binary heap	$\log V$	$\log V$	$\log V$	$E \log V$
d-way heap	$\log_d V$	$d \log_d V$	$\log_d V$	$E \log_{E/V} V$
Fibonacci heap	$1^\dagger$	$\log V^\dagger$	$1^\dagger$	$E + V \log V$

$^\dagger$  amortized

## Bottom line.

- Array implementation optimal for complete graphs.
- Binary heap much faster for sparse graphs.
- 4-way heap worth the trouble in performance-critical situations.
- Fibonacci heap best in theory, but not worth implementing.

## 4.3 MINIMUM SPANNING TREES

---

- ▶ *introduction*
- ▶ *cut property*
- ▶ *edge-weighted graph API*
- ▶ *Kruskal's algorithm*
- ▶ *Prim's algorithm*
- ▶ **context**

# Does a linear-time MST algorithm exist?

---

year	worst case	discovered by
1975	$E \log \log V$	<b>Yao</b>
1976	$E \log \log V$	<b>Cheriton-Tarjan</b>
1984	$E \log^* V, E + V \log V$	<b>Fredman-Tarjan</b>
1986	$E \log (\log^* V)$	<b>Gabow-Galil-Spencer-Tarjan</b>
1997	$E \alpha(V) \log \alpha(V)$	<b>Chazelle</b>
2000	$E \alpha(V)$	<b>Chazelle</b>
2002	<i>optimal</i>	<b>Pettie-Ramachandran</b>
20xx	$E$	<b>???</b>

deterministic compare-based MST algorithms

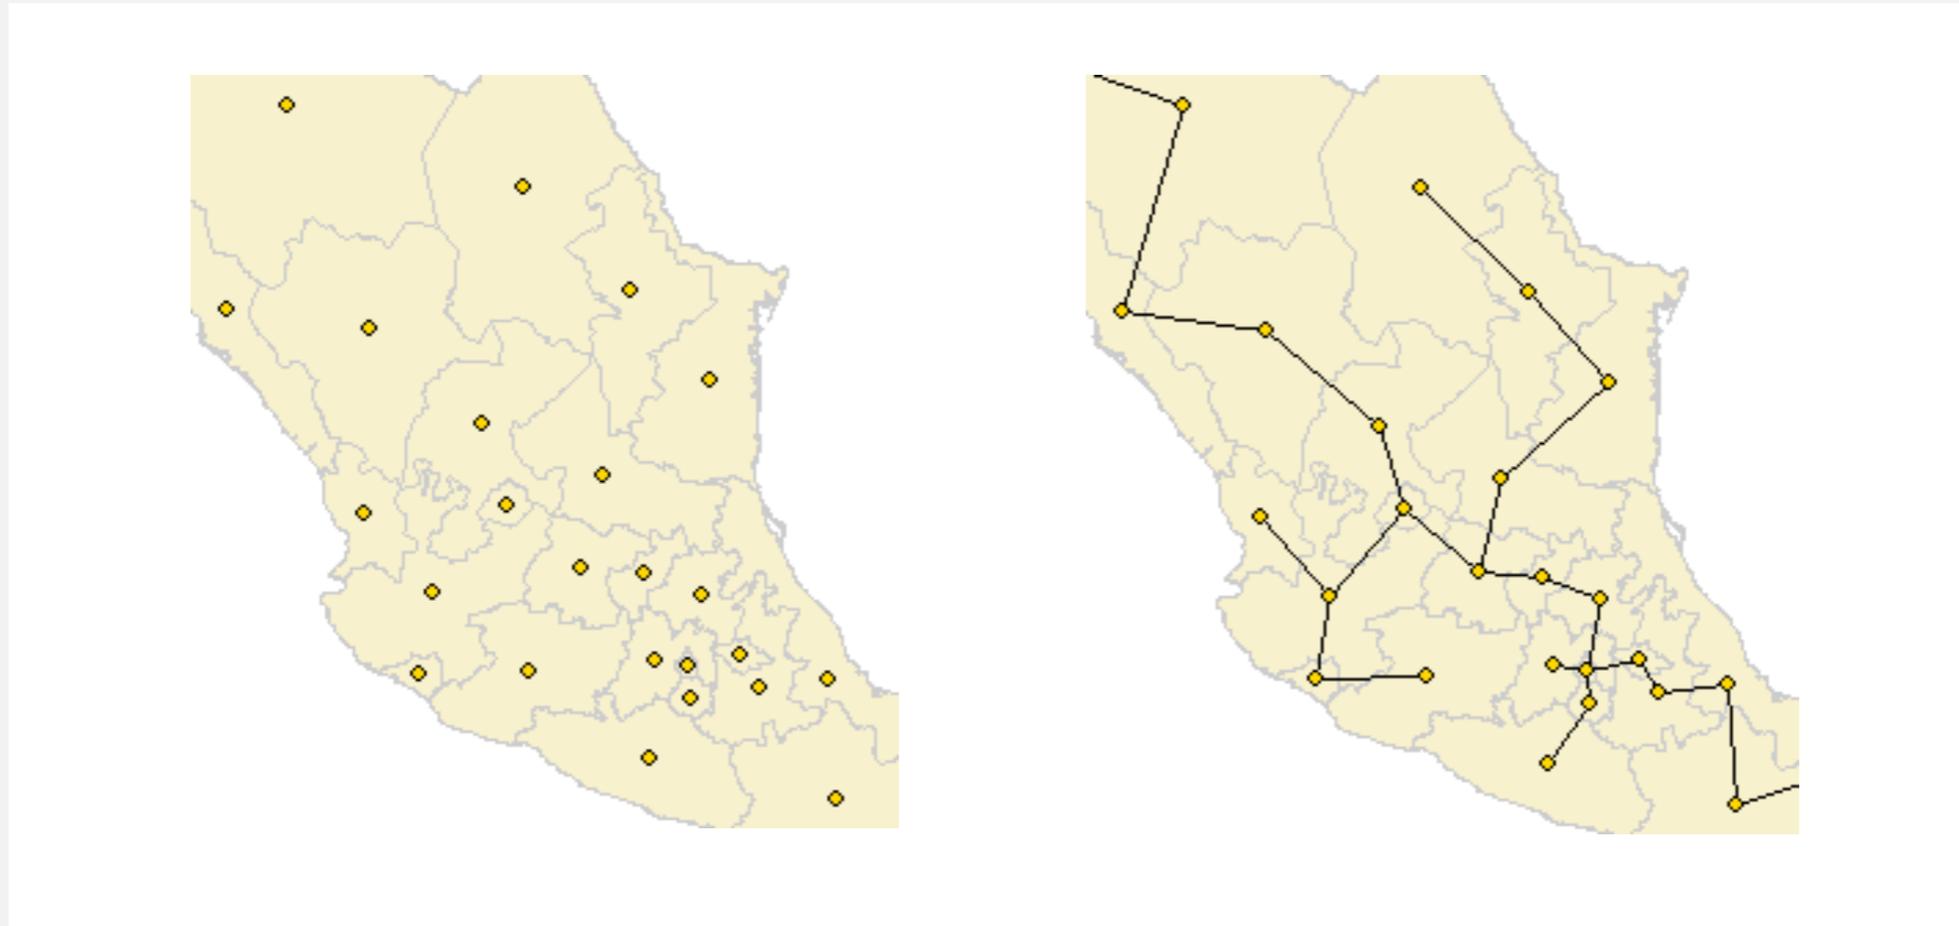

**Remark.** Linear-time randomized MST algorithm (Karger-Klein-Tarjan).

# Euclidean MST

---

Given  $n$  points in the plane, find MST connecting them, where the distances between point pairs are their **Euclidean** distances.

**Brute force.** Compute  $\sim n^2/2$  distances and run Prim's algorithm.

**Ingenuity.** Exploit geometry;  $n \log n$  using Delaunay triangulation.

# MINIMUM BOTTLENECK SPANNING TREE

**Problem.** Given an edge-weighted graph  $G$ , find a spanning tree that **minimizes the maximum weight** of its edges.

**Running time.**  $E \log E$  (or better).
