notes: <http://www.cs.princeton.edu/courses/archive/fall15/cos326/notes/reasoning-data.php>

A Note about Free Variables

- What are the free variables of the following expression?

```
if true then
  x
else
  y
```

- What are the free variables of the following expression?

```
(fun x y ->
  match x with
  [] -> 0
  | hd::tl -> w + hd) [] z
```

A Note about Free Variables

Key points:

- the free variables are determined by the syntactic structure (ie, by the tree-shape and the occurrence of binding sites) of the expression *only*
- the free variables are *independent of how an expression is evaluated.*

PROOFS ABOUT DATATYPES

Template for Inductive Proofs on Lists

Theorem: For all lists xs , $\text{property}(xs)$.

Proof: By induction on lists xs .

Case: $xs == []$:

... no uses of IH ...

Case: $xs == hd :: tl$:

IH: $\text{property}(tl)$

Template for Inductive Proofs on Lists

Theorem: For all lists xs , $\text{property}(xs)$.

Proof: By induction on lists xs .

Case: $xs == []$:

... no uses of IH ...

one case for empty list

Case: $xs == hd :: tl$:

IH: $\text{property}(tl)$

one case for non-empty lists

IH may be used on smaller lists

In general, cases must cover all the lists:

- other possibilities: case for $[]$, case for $x1::[]$, case for $x1::x2::tl$

Template for Inductive Proofs on Lists

Theorem: For all lists xs , $\text{property}(xs)$.

Proof: By induction on lists xs .

Case: $xs == []$:

... no uses of IH ...

one case for empty list

Case: $xs == hd :: tl$:

IH: $\text{property}(tl)$

one case for non-empty lists

IH may be used on smaller lists

In general, cases must cover all the lists:

- other possibilities: case for $[]$, case for $x1::[]$, case for $x1::x2::tl$

just splitting the case for non-empty lists in 2 again

More General Template for Inductive Datatypes

```
type t = C1 of t1 | C2 of t2 | ... | Cn of tn
```

types t1, t2 ... tn, may contain 1 or more occurrence of t within them.

Examples:

```
type mylist =  
  MyNil  
| MyCons of int * mylist
```

```
type 'a tree =  
  Leaf  
| Node of 'a * 'a tree * 'a tree
```

recursive occurrences

More General Template for Inductive Datatypes

`type t = C1 of t1 | C2 of t2 | ... | Cn of tn`

Theorem: For all $x : t$, $\text{property}(x)$.

Proof: By induction on structure of values x with type t .

More General Template for Inductive Datatypes

`type t = C1 of t1 | C2 of t2 | ... | Cn of tn`

Theorem: For all $x : t$, $\text{property}(x)$.

Proof: By induction on structure of values x with type t .

Case: $x == C1\ v$:

... use IH on components of v that have type t ...

Case: $x == C2\ v$:

... use IH on components of v that have type t ...

Case: $x == Cn\ v$:

... use IH on components of v that have type t ...

A PROOF ABOUT TREES

Another example

```
type 'a tree = Leaf | Node of 'a * 'a tree * 'a tree
```

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<>) f g =  
  fun x -> f (g x)
```

Another example

```
type 'a tree = Leaf | Node of 'a * 'a tree * 'a tree
```

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<>) f g =  
  fun x -> f (g x)
```

Theorem:

For all (total) functions $f : b \rightarrow c$,
For all (total) functions $g : a \rightarrow b$,
For all trees $t : \text{a tree}$,
 $\text{tm } f (\text{tm } g t) == \text{tm } (f \langle \rangle g) t$

“Forall intro”

Theorem:

For all (total) functions $f : b \rightarrow c$,
For all (total) functions $g : a \rightarrow b$,
For all trees $t : \text{a tree}$,
 $\text{tm } f (\text{tm } g t) == \text{tm } (f \langle \rangle g) t$

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

To begin, let's pick an arbitrary total function f and total function g . We'll prove the theorem without assuming any particular properties of f or g (other than the fact that the types match up). So, for the f and g we picked, we'll prove:

Theorem:

For all trees $t : \text{a tree}$,
 $\text{tm } f (\text{tm } g t) == \text{tm } (f \langle \rangle g) t$

Another example

Theorem:

For all trees t : a tree,
 $\text{tm } f (\text{tm } g \ t) == \text{tm } (f \langle \rangle g) \ t$

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

Another example

Theorem:

For all trees t : a tree,
 $\text{tm } f (\text{tm } g t) == \text{tm } (f \langle \rangle g) t$

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

Case: $t = \text{Leaf}$

No inductive hypothesis to use.

(Leaf doesn't contain any smaller components with type tree.)

Proof:

```
tm f (tm g Leaf)  
== tm f Leaf      (eval)  
== Leaf           (eval)  
== tm (f ⟨⟩ g) Leaf (reverse eval)
```

Another example

Theorem:

For all trees t : a tree,

$\text{tm } f (\text{tm } g \ t) == \text{tm } (f \langle \rangle g) \ t$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g \ l) == \text{tm } (f \langle \rangle g) \ l$

IH2: $\text{tm } f (\text{tm } g \ r) == \text{tm } (f \langle \rangle g) \ r$

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

Another example

Theorem:

For all trees t : a tree,
 $\text{tm } f (\text{tm } g \ t) == \text{tm } (f \langle \rangle g) \ t$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g \ l) == \text{tm } (f \langle \rangle g) \ l$

IH2: $\text{tm } f (\text{tm } g \ r) == \text{tm } (f \langle \rangle g) \ r$

Proof:

$\text{tm } f (\text{tm } g (\text{Node } (v, l, r)))$

$== \text{tm } (f \langle \rangle g) (\text{Node } (v, l, r))$

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

Another example

Theorem:

For all trees t : a tree,
 $\text{tm } f (\text{tm } g \ t) == \text{tm } (f \langle \rangle g) \ t$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g \ l) == \text{tm } (f \langle \rangle g) \ l$

IH2: $\text{tm } f (\text{tm } g \ r) == \text{tm } (f \langle \rangle g) \ r$

Proof:

$\text{tm } f (\text{tm } g (\text{Node } (v, l, r)))$
 $== \text{tm } f (\text{Node } (g \ v, \text{tm } g \ l, \text{tm } g \ r))$

(eval inner tm)

$== \text{tm } (f \langle \rangle g) (\text{Node } (v, l, r))$

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

Another example

Theorem:

For all trees t : a tree,
 $tm\ f\ (tm\ g\ t) == tm\ (f\ \langle \rangle\ g)\ t$

Case: $t = Node(v, l, r)$

IH1: $tm\ f\ (tm\ g\ l) == tm\ (f\ \langle \rangle\ g)\ l$

IH2: $tm\ f\ (tm\ g\ r) == tm\ (f\ \langle \rangle\ g)\ r$

Proof:

$tm\ f\ (tm\ g\ (Node\ (v, l, r)))$
 $== tm\ f\ (Node\ (g\ v, tm\ g\ l, tm\ g\ r))$ (eval inner tm)

$Node\ ((f\ \langle \rangle\ g)\ v, tm\ (f\ \langle \rangle\ g)\ l, tm\ (f\ \langle \rangle\ g)\ r)$
 $== tm\ (f\ \langle \rangle\ g)\ (Node\ (v, l, r))$ (eval reverse)

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

Another example

Theorem:

For all trees t : a tree,
 $tm\ f\ (tm\ g\ t) == tm\ (f\ \langle \rangle\ g)\ t$

Case: $t = Node(v, l, r)$

IH1: $tm\ f\ (tm\ g\ l) == tm\ (f\ \langle \rangle\ g)\ l$

IH2: $tm\ f\ (tm\ g\ r) == tm\ (f\ \langle \rangle\ g)\ r$

Proof:

$tm\ f\ (tm\ g\ (Node\ (v, l, r)))$
 $== tm\ f\ (Node\ (g\ v, tm\ g\ l, tm\ g\ r))$ (eval inner tm)
 $== Node\ (f\ (g\ v), tm\ f\ (tm\ g\ l), tm\ f\ (tm\ g\ r))$ (eval – since g, tm are total)

$Node\ ((f\ \langle \rangle\ g)\ v, tm\ (f\ \langle \rangle\ g)\ l, tm\ (f\ \langle \rangle\ g)\ r)$
 $== tm\ (f\ \langle \rangle\ g)\ (Node\ (v, l, r))$ (eval reverse)

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

Another example

Theorem:

For all trees t : a tree,

$$\text{tm } f \text{ (tm } g \text{ t)} == \text{tm } (f \langle \rangle g) \text{ t}$$

Case: $t = \text{Node}(v, l, r)$

$$\text{IH1: } \text{tm } f \text{ (tm } g \text{ l)} == \text{tm } (f \langle \rangle g) \text{ l}$$

$$\text{IH2: } \text{tm } f \text{ (tm } g \text{ r)} == \text{tm } (f \langle \rangle g) \text{ r}$$

Proof:

$$\begin{aligned} & \text{tm } f \text{ (tm } g \text{ (Node } (v, l, r))) \\ == & \text{tm } f \text{ (Node } (g \text{ v, tm } g \text{ l, tm } g \text{ r))} && \text{(eval inner tm)} \\ == & \text{Node } (f \text{ (g v), tm } f \text{ (tm } g \text{ l), tm } f \text{ (tm } g \text{ r))} && \text{(eval – since g, tm are total)} \end{aligned}$$

$$\begin{aligned} & \text{Node } ((f \langle \rangle g) \text{ v, tm } (f \langle \rangle g) \text{ l, tm } f \text{ (tm } g \text{ r))} \\ == & \text{Node } ((f \langle \rangle g) \text{ v, tm } (f \langle \rangle g) \text{ l, tm } (f \langle \rangle g) \text{ r)} && \text{(IH2)} \\ == & \text{tm } (f \langle \rangle g) \text{ (Node } (v, l, r)) && \text{(eval reverse)} \end{aligned}$$

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

Another example

Theorem:

For all trees t : a tree,

$$\text{tm } f (\text{tm } g \ t) == \text{tm } (f \langle \rangle g) \ t$$

Case: $t = \text{Node}(v, l, r)$

$$\text{IH1: } \text{tm } f (\text{tm } g \ l) == \text{tm } (f \langle \rangle g) \ l$$

$$\text{IH2: } \text{tm } f (\text{tm } g \ r) == \text{tm } (f \langle \rangle g) \ r$$

Proof:

$$\begin{aligned} & \text{tm } f (\text{tm } g (\text{Node } (v, l, r))) \\ \Rightarrow & \text{tm } f (\text{Node } (g \ v, \text{tm } g \ l, \text{tm } g \ r)) && \text{(eval inner tm)} \\ \Rightarrow & \text{Node } (f \ (g \ v), \text{tm } f (\text{tm } g \ l), \text{tm } f (\text{tm } g \ r)) && \text{(eval – since g, tm are total)} \\ \Rightarrow & \text{Node } ((f \langle \rangle g) \ v, \text{tm } f (\text{tm } g \ l), \text{tm } f (\text{tm } g \ r)) \\ \Rightarrow & \text{Node } ((f \langle \rangle g) \ v, \text{tm } (f \langle \rangle g) \ l, \text{tm } f (\text{tm } g \ r)) && \text{(IH1)} \\ \Rightarrow & \text{Node } ((f \langle \rangle g) \ v, \text{tm } (f \langle \rangle g) \ l, \text{tm } (f \langle \rangle g) \ r) && \text{(IH2)} \\ \Rightarrow & \text{tm } (f \langle \rangle g) (\text{Node } (v, l, r)) && \text{(eval reverse)} \end{aligned}$$

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (⟨⟩) f g =  
  fun x -> f (g x)
```

Another example

Theorem:

For all trees t : a tree,
 $tm\ f\ (tm\ g\ t) == tm\ (f\ <>\ g)\ t$

Case: $t = Node(v, l, r)$

IH1: $tm\ f\ (tm\ g\ l) == tm\ (f\ <>\ g)\ l$

IH2: $tm\ f\ (tm\ g\ r) == tm\ (f\ <>\ g)\ r$

Proof:

$tm\ f\ (tm\ g\ (Node\ (v, l, r)))$	
$== tm\ f\ (Node\ (g\ v, tm\ g\ l, tm\ g\ r))$	(eval inner tm)
$== Node\ (f\ (g\ v), tm\ f\ (tm\ g\ l), tm\ f\ (tm\ g\ r))$	(eval – since g, tm are total)
$== Node\ ((f\ <>\ g)\ v, tm\ f\ (tm\ g\ l), tm\ f\ (tm\ g\ r))$	(eval reverse)
$== Node\ ((f\ <>\ g)\ v, tm\ (f\ <>\ g)\ l, tm\ f\ (tm\ g\ r))$	(IH1)
$== Node\ ((f\ <>\ g)\ v, tm\ (f\ <>\ g)\ l, tm\ (f\ <>\ g)\ r)$	(IH2)
$== tm\ (f\ <>\ g)\ (Node\ (v, l, r))$	(eval reverse)

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<>) f g =  
  fun x -> f (g x)
```

Summary: Proof Template for Trees

```
type 'a tree = Leaf | Node of 'a * 'a tree * 'a tree
```

Theorem: For all $x : 'a \text{ tree}$, $\text{property}(x)$.

Proof: By induction on the structure of trees x .

Case: $x == \text{Leaf}$:

... no use of inductive hypothesis (this is the smallest tree) ...

Case: $x == \text{Node}(v, \text{left}, \text{right})$:

IH1: $\text{property}(\text{left})$

IH2: $\text{property}(\text{right})$

... use IH1 and IH 2 in your proof ...

A PROOF ABOUT EXPRESSIONS

A simple expression language

type id = string

type exp = Int of int | Add of exp * exp | Var of id

A simple expression language

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

let e1 = Add (Int 3, Var "x")
```

A simple expression language

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int
```

A simple expression language

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval} (\text{opt } e) == \text{eval } e$

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval} (\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval} (\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Int } i$
 $\text{eval} (\text{opt } (\text{Int } i))$

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval} (\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Int } i$

$\text{eval} (\text{opt} (\text{Int } i))$ (RHS)
 $== \text{eval} (\text{Int } i)$ (eval of opt)

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval} (\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Int } i$

$\text{eval} (\text{opt} (\text{Int } i))$ (RHS)
 $== \text{eval} (\text{Int } i)$ (eval of opt)

case done!
(we reached the LHS
from RHS)

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval} (\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Add}(\text{Int } 0, e2)$

IH: $\text{eval} (\text{opt } e2) == \text{eval } e2$

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval} (\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Add}(\text{Int } 0, e2)$

IH: $\text{eval} (\text{opt } e2) == \text{eval } e2$

$\text{eval} (\text{opt} (\text{Add}(\text{Int } 0, e2)))$ (LHS)

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  match e with
  | Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

Theorem:

  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1, e2) ->
    (opt e1, opt e2)
  | Var x -> Var x
```

PROOF DONE!!!

eval (opt e) == eval e

Proof:

Case: $e = \text{Var } x$

$\text{eval (opt (Var } x)) = \text{eval (Var } x)$ (LHS) (by definition of opt)

eval (opt e) == eval e
the
LHS =

Summary of Template for Inductive Datatypes

`type t = C1 of t1 | C2 of t2 | ... | Cn of tn`

Theorem: For all $x : t$, $\text{property}(x)$.

Proof: By induction on structure of values x with type t .

Case: $x == C1\ v$:

... use IH on components of v that have type t ...

Case: $x == C2\ v$:

... use IH on components of v that have type t ...

Case: $x == Cn\ v$:

... use IH on components of v that have type t ...

use patterns
that divide
up the cases

Take inspiration
from the
structure of the
program

Exercise

```
type 'a tree = Leaf of 'a | Node of 'a tree * 'a tree
```

```
let rec flip (t: 'a tree) =
```

```
  match t with
```

```
  | Leaf _ -> t
```

```
  | Node (a,b) -> Node (flip b, flip a)
```

Theorem: $\text{flip}(\text{flip } t) = t$.

Exercise

```
type 'a tree = Leaf of 'a | Node of 'a tree * 'a tree
```

```
let rec flip (t: 'a tree) =
```

```
  match t with
```

```
  | Leaf _ -> t
```

```
  | Node (a,b) -> Node (flip b, flip a)
```

Theorem: $\text{flip}(\text{flip } t) = t$.

Theorem: $\text{flip}(\text{flip}(\text{flip } t)) = \text{flip } t$.
