2.4 PRIORITY QUEUES

- ▶ *API and elementary implementations*
- ▶ *binary heaps*
- ▶ *heapsort*
- ▶ *event-driven simulation*

Collections

A **collection** is a data type that stores a group of items.

data type	core operations	data structure
stack	PUSH, POP	<i>linked list, resizing array</i>
queue	ENQUEUE, DEQUEUE	<i>linked list, resizing array</i>
priority queue	INSERT, DELETE-MAX	<i>binary heap</i>
symbol table	PUT, GET, DELETE	<i>binary search tree, hash table</i>
set	ADD, CONTAINS, DELETE	<i>binary search tree, hash table</i>

“ Show me your code and conceal your data structures, and I shall continue to be mystified. Show me your data structures, and I won’t usually need your code; it’ll be obvious.” — Fred Brooks

Priority queue

Collections. Insert and delete items. Which item to delete?

Stack. Remove the item most recently added.

Queue. Remove the item least recently added.

Randomized queue. Remove a random item.

Priority queue. Remove the **largest** (or **smallest**) item.

Generalizes: stack, queue, randomized queue.

operation	argument	return value
insert	P	
insert	Q	
insert	E	
remove max		Q
insert	X	
insert	A	
insert	M	
remove max		X
insert	P	
insert	L	
insert	E	
remove max		P

Priority queue API

Requirement. Keys are generic; they must also be Comparable.

public class MaxPQ <Key extends Comparable<Key>>		Key must be Comparable ("bounded type parameter") 
MaxPQ()		<i>create an empty priority queue</i>
MaxPQ(Key[] a)		<i>create a priority queue with given keys</i>
void insert(Key v)		<i>insert a key into the priority queue</i>
Key delMax()		<i>return and remove a largest key</i>
boolean isEmpty()		<i>is the priority queue empty?</i>
Key max()		<i>return a largest key</i>
int size()		<i>number of entries in the priority queue</i>

Note. Duplicate keys allowed; delMax() picks any maximum key.

Priority queue: applications

- Event-driven simulation. [customers in a line, colliding particles]
- Numerical computation. [reducing roundoff error]
- Discrete optimization. [bin packing, scheduling]
- Artificial intelligence. [A* search]
- Computer networks. [web cache]
- Data compression. [Huffman codes]
- Operating systems. [load balancing, interrupt handling]
- Graph searching. [Dijkstra's algorithm, Prim's algorithm]
- Number theory. [sum of powers]
- Spam filtering. [Bayesian spam filter]
- Statistics. [online median in data stream]

Priority queue: client example

Challenge. Find the largest m items in a stream of n items.

- Fraud detection: isolate \$\$ transactions.
- NSA monitoring: flag most suspicious documents.

n huge, m large

Constraint. Not enough memory to store n items.

use a min-oriented
priority queue

```
MinPQ<Double> pq = new MinPQ<Double>();  
while (StdIn.isEmpty())  
{  
    double value = StdIn.readDouble();  
    pq.insert(value);  
    if (pq.size() > m)  
        pq.delMin();  
}
```

pq now contains
largest m numbers

Priority queue: client example

Challenge. Find the largest m items in a stream of n items.

implementation	time	space
sort	$n \log n$	n
elementary PQ	$m n$	m
binary heap	$n \log m$	m
best in theory	n	m

order of growth of finding the largest m in a stream of n items

Priority queue: elementary implementation

operation	argument	return value	size	contents (unordered)					contents (ordered)				
insert	P		1	P					P				
insert	Q		2	P	Q				P	Q			
insert	E		3	P	Q	E			E	P	Q		
remove max		Q	2	P	E				E	P			
insert	X		3	P	E	X			E	P	X		
insert	A		4	P	E	X	A		A	E	P	X	
insert	M		5	P	E	X	A	M	A	E	M	P	X
remove max		X	4	P	E	M	A		A	E	M	P	
insert	P		5	P	E	M	A	P	A	E	M	P	P
insert	L		6	P	E	M	A	P	L	E	M	P	P
insert	E		7	P	E	M	A	P	L	E	L	M	P
remove max		P	6	E	E	M	A	P	L	E	L	M	P

In the worst case, what are the running times for INSERT and DELETE-MAX for a priority queue implemented with an **ordered array**?

- A. 1 and 1
- B. 1 and n
- C. n and 1
- D. n and n

0	1	2	3	4	5	6	7	8	9	10
A	E	E	L	M	P	X				

Priority queue: implementations cost summary

Challenge. Implement **all** operations efficiently.

implementation	INSERT	DELETE-MAX	MAX
unordered array	1	n	n
ordered array	n	1	1
goal	$\log n$	$\log n$	$\log n$

order of growth of running time for priority queue with n items

what might this mean?

Solution. “Somewhat-ordered” array.

<https://algs4.cs.princeton.edu>

2.4 PRIORITY QUEUES

- ▶ *API and elementary implementations*
- ▶ *binary heaps*
- ▶ *heapsort*
- ▶ *event-driven simulation*

Complete binary tree

Binary tree. Empty **or** node with links to left and right binary trees.

Complete tree. Every level (except possibly the last) is completely filled; the last level is filled from left to right.

complete binary tree with $n = 16$ nodes (height = 4)

Property. Height of complete binary tree with n nodes is $\lfloor \lg n \rfloor$.

Pf. Height increases only when n is a power of 2.

A complete binary tree in nature

Hyphaene Compressa - Doum Palm

© Shlomit Pinter

Binary heap: representation

Binary heap. Array representation of a heap-ordered complete binary tree.

Heap-ordered binary tree.

- Keys in nodes.
- Parent's key no smaller than children's keys.

Array representation.

- Indices start at 1.
- Take nodes in **level** order.
- No explicit links needed!

Heap representations

Which is the index of the parent of the item at index k in a binary heap?

- A. $k/2 - 1$
- B. $k/2$
- C. $k/2 + 1$
- D. $2*k$

i	0	1	2	3	4	5	6	7	8	9	10	11
a[i]	-	T	S	R	P	N	O	A	E	I	H	G

Binary heap: properties

Proposition. Largest key is $a[1]$, which is root of binary tree.

Proposition. Can use array indices to move through tree.

- Parent of node at k is at $k/2$.
- Children of node at k are at $2k$ and $2k+1$.

Binary heap demo

Insert. Add node at end, then swim it up.

Remove the maximum. Exchange root with node at end, then sink it down.

heap ordered

Binary heap: promotion

Scenario. A key becomes **larger** than its parent's key.

To eliminate the violation:

- Exchange key in child with key in parent.
- Repeat until heap order restored.

```
private void swim(int k)
{
    while (k > 1 && less(k/2, k))
    {
        exch(k, k/2);
        k = k/2;
    }
}
```

parent of node at k is at k/2

Peter principle. Node promoted to level of incompetence.

Binary heap: insertion

Insert. Add node at end, then swim it up.

Cost. At most $1 + \lg n$ compares.

```
public void insert(Key x)
{
    pq[++n] = x;
    swim(n);
}
```

insert

Binary heap: demotion

Scenario. A key becomes **smaller** than one (or both) of its children's.

To eliminate the violation:

why not smaller child?

- Exchange key in parent with key in larger child.
- Repeat until heap order restored.

```
private void sink(int k)
{
    while (2*k <= n)
    {
        int j = 2*k;
        if (j < n && less(j, j+1)) j++;
        if (!less(k, j)) break;
        exch(k, j);
        k = j;
    }
}
```

children of node at k
are $2*k$ and $2*k+1$

Top-down reheapify (sink)

Power struggle. Better subordinate promoted.

Binary heap: delete the maximum

Delete max. Exchange root with node at end, then sink it down.

Cost. At most $2 \lg n$ compares.

```
public Key delMax()
{
    Key max = pq[1];
    exch(1, n--);
    sink(1);
    pq[n+1] = null; ← prevent loitering
    return max;
}
```

remove the maximum

Binary heap: Java implementation

```
public class MaxPQ<Key extends Comparable<Key>>
{
```

```
    private Key[] pq;
    private int n;
```

```
    public MaxPQ(int capacity)
    {   pq = (Key[]) new Comparable[capacity+1];   }
```

← fixed capacity
(for simplicity)

```
    public boolean isEmpty()
    {   return n == 0;   }
    public void insert(Key key)    // see previous code
    public Key delMax()           // see previous code
```

← PQ ops

```
    private void swim(int k)      // see previous code
    private void sink(int k)      // see previous code
```

← heap helper functions

```
    private boolean less(int i, int j)
    {   return pq[i].compareTo(pq[j]) < 0;   }
    private void exch(int i, int j)
    {   Key t = pq[i]; pq[i] = pq[j]; pq[j] = t;   }
```

← array helper functions

```
}
```

<https://algs4.cs.princeton.edu/24pq/MaxPQ.java.html>

Priority queue: implementations cost summary

implementation	INSERT	DELETE-MAX	MAX
unordered array	1	n	n
ordered array	n	1	1
binary heap	$\log n$	$\log n$	1

order of growth of running time for priority queue with n items

PRIORITY QUEUE WITH DELETE-RANDOM

Goal. Design an efficient data structure to support the following ops:

- INSERT: insert a key.
- DELETE-MAX: delete and return a max key.
- SAMPLE: return a random.
- DELETE-RANDOM: delete and return a random key.

DELETE-RANDOM FROM A BINARY HEAP

Goal. Delete a random key from a binary heap in logarithmic time.

DELETE-RANDOM FROM A BINARY HEAP

Goal. Delete a random key from a binary heap in logarithmic time.

Solution.

- Pick a random index r between 1 and n .
- Perform `exch( $r$ ,  $n--$ )`.
- Perform `sink( $r$ )`.

DELETE-RANDOM FROM A BINARY HEAP

Goal. Delete a random key from a binary heap in logarithmic time.

Solution.

- Pick a random index r between 1 and n .
- Perform $\text{exch}(r, n--)$.
- Or perform $\text{swim}(r)$.

Binary heap: considerations

Underflow and overflow.

- Underflow: throw exception if deleting from empty PQ.
- Overflow: add no-arg constructor and use resizing array.

leads to $\log n$
amortized time per op
(how to make worst case?)

Minimum-oriented priority queue.

- Replace `less()` with `greater()`.
- Implement `greater()`.

Other operations.

- Remove an arbitrary item.
- Change the priority of an item.

can implement efficiently with `sink()` and `swim()`
[stay tuned for Prim/Dijkstra]

Immutability of keys.

- Assumption: client does not change keys while they're on the PQ.
- Best practice: use immutable keys.

Immutability: implementing in Java

Data type. Set of values and operations on those values.

Immutable data type. Can't change the data type value once created.

```
public final class Vector {  
    private final int n;  
    private final double[] data;
```

← instance variables private and final
(neither necessary nor sufficient,
but good programming practice)

```
    public Vector(double[] data) {  
        this.n = data.length;  
        this.data = new double[n];  
        for (int i = 0; i < n; i++)  
            this.data[i] = data[i];  
    }
```

← defensive copy of mutable
instance variables

```
    :  
    :  
}
```

← instance methods don't
change instance variables

Immutable. String, Integer, Double, Color, Vector, Point2D, ...

Mutable. StringBuilder, Stack, Java array types, java.util.Date, ...

Immutability: properties

Data type. Set of values and operations on those values.

Immutable data type. Can't change the data type value once created.

Advantages.

- Simplifies debugging.
- Simplifies concurrent programming.
- More secure in presence of hostile code.
- Safe to use as key in priority queue or symbol table.

Disadvantage. Must create new object for each data-type value.

“Classes should be immutable unless there’s a very good reason to make them mutable.... If a class cannot be made immutable, you should still limit its mutability as much as possible.”

— Joshua Bloch (Java architect)

Binary heap: practical improvements

Do “half exchanges” in sink and swim.

- Reduces number of array accesses.
- Worth doing.

Binary heap: practical improvements

Floyd's "bounce" heuristic.

- Sink key at root all the way to bottom. ← only 1 compare per node
- Swim key back up. ← some extra compares and exchanges
- Overall, fewer compares; more exchanges.

R. W. Floyd
1978 Turing award

Binary heap: practical improvements

Multiway heaps.

- Complete d -way tree.
- Parent's key no smaller than its children's keys.

Fact. Height of complete d -way tree on n nodes is $\sim \log_d n$.

3-way heap

In the worst case, how many compares to **INSERT** and **DELETE-MAX** in a d -way heap?

- A. $\sim \log_d n$ and $\log_d n$
- B. $\sim \log_d n$ and $d \log_d n$
- C. $\sim d \log_d n$ and $\log_d n$
- D. $\sim d \log_d n$ and $d \log_d n$

Priority queue: implementation cost summary

implementation	INSERT	DELETE-MAX	MAX
unordered array	1	n	n
ordered array	n	1	1
binary heap	$\log n$	$\log n$	1
d-ary heap	$\log_d n$	$d \log_d n$	1
Fibonacci	1	$\log n^\dagger$	1
Brodal queue	1	$\log n$	1
impossible	1	1	1

← sweet spot: $d = 4$

← why impossible?

† amortized

order-of-growth of running time for priority queue with n items

<https://algs4.cs.princeton.edu>

2.4 PRIORITY QUEUES

- ▶ *API and elementary implementations*
- ▶ *binary heaps*
- ▶ *heapsort*
- ▶ *event-driven simulation*

What are the properties of this sorting algorithm?

```
public void sort(String[] a)
{
    int n = a.length;
    MaxPQ<String> pq = new MaxPQ<String>();
    for (int i = 0; i < n; i++)
        pq.insert(a[i]);
    for (int i = n-1; i >= 0; i--)
        a[i] = pq.delMax();
}
```

- A. $n \log n$ compares in the worst case.
- B. In-place.
- C. Stable.
- D. *All of the above.*

Heapsort

Basic plan for in-place sort.

- View input array as a complete binary tree.
- Heap construction: build a max-heap with all n keys.
- Sortdown: repeatedly remove the maximum key.

keys in arbitrary order

1	2	3	4	5	6	7	8	9	10	11
S	O	R	T	E	X	A	M	P	L	E

build max heap
(in place)

1	2	3	4	5	6	7	8	9	10	11
X	T	S	P	L	R	A	M	O	E	E

sorted result
(in place)

1	2	3	4	5	6	7	8	9	10	11
A	E	E	L	M	O	P	R	S	T	X

Heapsort demo

Heap construction. Build max heap using bottom-up method.

for now, assume array entries are indexed 1 to n

array in arbitrary order

S	O	R	T	E	X	A	M	P	L	E
1	2	3	4	5	6	7	8	9	10	11

Heapsort demo

Sortdown. Repeatedly delete the largest remaining item.

array in sorted order

Heapsort: heap construction

First pass. Build heap using bottom-up method.

```
for (int k = n/2; k >= 1; k--)  
    sink(a, k, n);
```

Heapsort: sortdown

Second pass.

- Remove the maximum, one at a time.
- Leave in array, instead of nulling out.

```
while (n > 1)
{
    exch(a, 1, n--);
    sink(a, 1, n);
}
```

Heapsort: Java implementation

```
public class Heap
{
    public static void sort(Comparable[] a)
    {
        int n = a.length;
        for (int k = n/2; k >= 1; k--)
            sink(a, k, n);
        while (n > 1)
        {
            exch(a, 1, n);
            sink(a, 1, --n);
        }
    }
}
```

```
private static void sink(Comparable[] a, int k, int n)
{ /* as before */ }
```

← but make static (and pass arguments)

```
private static boolean less(Comparable[] a, int i, int j)
{ /* as before */ }
```

```
private static void exch(Object[] a, int i, int j)
{ /* as before */ }
```

← but convert from 1-based indexing to 0-base indexing

```
}
```

Heapsort trace (array contents just after each sink)

Heapsort: mathematical analysis

Proposition. Heap construction makes $\leq n$ exchanges and $\leq 2n$ compares.

Pf sketch. [assume $n = 2^{h+1} - 1$]

binary heap of height $h = 3$

$$\begin{aligned} h + 2(h-1) + 4(h-2) + 8(h-3) + \dots + 2^h(0) &= 2^{h+1} - h - 2 \\ &= n - (h-1) \\ &\leq n \end{aligned}$$

a tricky sum
(see COS 340)

Heapsort: mathematical analysis

Proposition. Heap construction uses $\leq 2n$ compares and $\leq n$ exchanges.

Proposition. Heapsort uses $\leq 2n \lg n$ compares and exchanges.

algorithm can be improved to $\sim 1n \lg n$
(but no such variant is known to be practical)

Significance. In-place sorting algorithm with $n \log n$ worst-case.

- Mergesort: no, linear extra space. ← in-place merge possible, not practical
- Quicksort: no, quadratic time in worst case. ← $n \log n$ worst-case quicksort possible, not practical
- Heapsort: yes!

Bottom line. Heapsort is optimal for both time and space, **but:**

- Inner loop longer than quicksort's.
- Makes poor use of cache.
- Not stable.

can be improved using
advanced caching tricks

Introsort

Goal. As fast as quicksort in practice; $n \log n$ worst case, in place.

Introsort.

- Run quicksort.
- Cutoff to heapsort if stack depth exceeds $2 \lg n$.
- Cutoff to insertion sort for $n = 16$.

Introspective Sorting and Selection Algorithms

David R. Musser*
Computer Science Department
Rensselaer Polytechnic Institute, Troy, NY 12180
musser@cs.rpi.edu

Abstract

Quicksort is the preferred in-place sorting algorithm in many contexts, since its average computing time on uniformly distributed inputs is $\Theta(N \log N)$ and it is in fact faster than most other sorting algorithms on most inputs. Its drawback is that its worst-case time bound is $\Theta(N^2)$. Previous attempts to protect against the worst case by improving the way quicksort chooses pivot elements for partitioning have increased the average computing time too much—one might as well use heapsort, which has a $\Theta(N \log N)$ worst-case time bound but is on the average 2 to 5 times slower than quicksort. A similar dilemma exists with selection algorithms (for finding the i -th largest element) based on partitioning. This paper describes a simple solution to this dilemma: limit the depth of partitioning, and for subproblems that exceed the limit switch to another algorithm with a better worst-case bound. Using heapsort as the “stopper” yields a sorting algorithm that is just as fast as quicksort in the average case but also has an $\Theta(N \log N)$ worst case time bound. For selection, a hybrid of Hoare’s FIND algorithm, which is linear on average but quadratic in the worst case, and the Blum-Floyd-Pratt-Rivest-Tarjan algorithm is as fast as Hoare’s algorithm in practice, yet has a linear worst-case time bound. Also discussed are issues of implementing the new algorithms as generic algorithms and accurately measuring their performance in the framework of the C++ Standard Template Library.

In the wild. C++ STL, Microsoft .NET Framework.

Sorting algorithms: summary

	inplace?	stable?	best	average	worst	remarks
selection	✓		$\frac{1}{2} n^2$	$\frac{1}{2} n^2$	$\frac{1}{2} n^2$	n exchanges
insertion	✓	✓	n	$\frac{1}{4} n^2$	$\frac{1}{2} n^2$	use for small n or partially ordered
shell	✓		$n \log_3 n$	?	$c n^{3/2}$	tight code; subquadratic
merge		✓	$\frac{1}{2} n \lg n$	$n \lg n$	$n \lg n$	$n \log n$ guarantee; stable
timsort		✓	n	$n \lg n$	$n \lg n$	improves mergesort when preexisting order
quick	✓		$n \lg n$	$2 n \ln n$	$\frac{1}{2} n^2$	$n \log n$ probabilistic guarantee; fastest in practice
3-way quick	✓		n	$2 n \ln n$	$\frac{1}{2} n^2$	improves quicksort when duplicate keys
heap	✓		$3 n$	$2 n \lg n$	$2 n \lg n$	$n \log n$ guarantee; in-place
?	✓	✓	n	$n \lg n$	$n \lg n$	holy sorting grail
