- ▶ *MSD radix sort*
- ▶ *3-way radix quicksort*
- ▶ *suffix arrays*

# String processing

---

**String.** Sequence of characters.

**Important fundamental abstraction.**

- Programming systems (e.g., Java programs).
- Communication systems (e.g., email).
- Information processing.
- Genomic sequences.
- ...

*“ The digital information that underlies biochemistry, cell biology, and development can be represented by a simple string of G’s, A’s, T’s and C’s. This string is the root data structure of an organism’s biology. ” — M. V. Olson*

# The char data type

**C char data type.** Typically an 8-bit integer.

- Supports 7-bit ASCII.
- Can represent only 256 characters.

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
0	NUL	SOH	STX	ETX	EOT	ENQ	ACK	BEL	BS	HT	LF	VT	FF	CR	SO	SI
1	DLE	DC1	DC2	DC3	DC4	NAK	SYN	ETB	CAN	EM	SUB	ESC	FS	GS	RS	US
2	SP	!	"	#	\$	%	&	'	(	)	*	+	,	-	.	/
3	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?

5	P	Q	R	S	T	U	V	W	X	Y	Z	[	\	]	^	_
6	`	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
7	p	q	r	s	t	u	v	w	x	y	z	{		}	~	DEL

all  $2^7 = 128$  ASCII characters

A      á      ð      🍌  
U+0041    U+00E1    U+2202    U+1F4A9

some Unicode characters

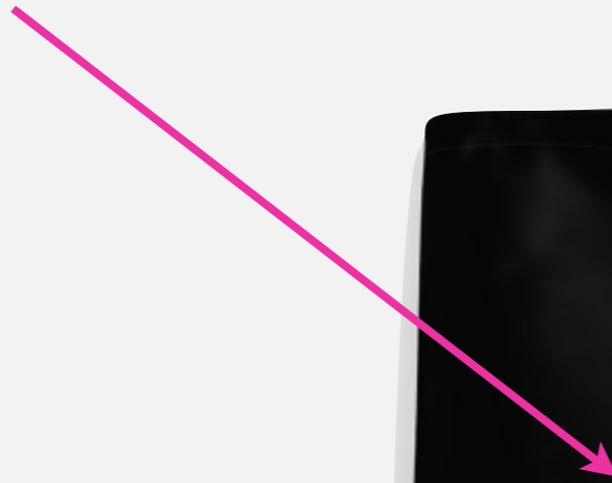

**Java char data type.** A 16-bit unsigned integer.

- Supports 16-bit Unicode 1.0.
- Supports 21-bit Unicode 8.0 (awkwardly). ← 120,737 characters and emoji

# I 💖 Unicode

---

U+1F496

# The String data type (in Java)

---

**String data type.** Immutable sequence of characters.

**Java representation.** A fixed-length `char[]` array.

operation	description	Java	running time
<b>length</b>	number of characters	<code>s.length()</code>	1
<b>indexing</b>	$i^{\text{th}}$ character	<code>s.charAt(i)</code>	1
<b>concatenation</b>	concatenate one string to the end of the other	<code>s + t</code>	$m + n$
...			

# String performance trap

---

Q. How to build a long string, one character at a time?

```
public static String reverse(String s)
{
    String reverse = "";
    for (int i = s.length() - 1; i >= 0; i--)
        reverse += s.charAt(i);
    return reverse;
}
```

quadratic time  
(1 + 2 + 3 + ... + n)

**StringBuilder data type.** Mutable sequence of characters.

**Java representation.** A resizing char[] array.

```
public static String reverse(String s)
{
    StringBuilder reverse = new StringBuilder();
    for (int i = s.length() - 1; i >= 0; i--)
        reverse.append(s.charAt(i));
    return reverse.toString();
}
```

linear time

# THE STRING DATA TYPE: IMMUTABILITY

Q. Why are Java strings immutable?

# Program optimization

---

*“ The first rule of program optimization: don't do it.  
The second rule of program optimization (for experts only):  
don't do it yet. ” – Michael A. Jackson*

# Review: summary of the performance of sorting algorithms

Frequency of operations.

algorithm	guarantee	random	extra space	stable?	operations on keys
insertion sort	$\frac{1}{2} n^2$	$\frac{1}{4} n^2$	1	✓	compareTo()
mergesort	$n \lg n$	$n \lg n$	$n$	✓	compareTo()
quicksort	$1.39 n \lg n^*$	$1.39 n \lg n$	$c \lg n^*$		compareTo()
heapsort	$2 n \lg n$	$2 n \lg n$	1		compareTo()

\* probabilistic

compareTo() not constant time for strings

**Lower bound.**  $\sim n \lg n$  compares required by any compare-based algorithm.

**Q.** Can we sort strings faster (despite lower bound)?

**A.** Yes, by exploiting access to individual characters.

use characters to make  
R-way decisions  
(instead of binary decisions)

# Key-indexed counting: assumptions about keys

---

**Assumption.** Each key is an integer between 0 and  $R - 1$ .

**Implication.** Can use key as an array index.

## Applications.

- Sort string by first letter.
- Sort phone numbers by area code.
- Sort class roster by section number.
- Subroutine in a string sorting algorithm.

**Remark.** Keys may have associated data  $\Rightarrow$  can't simply count keys of each value.

# Least-significant-digit-first (LSD) radix sort

- Consider characters from **right to left**.
- Stably sort using  $d^{\text{th}}$  character as the key (using key-indexed counting).

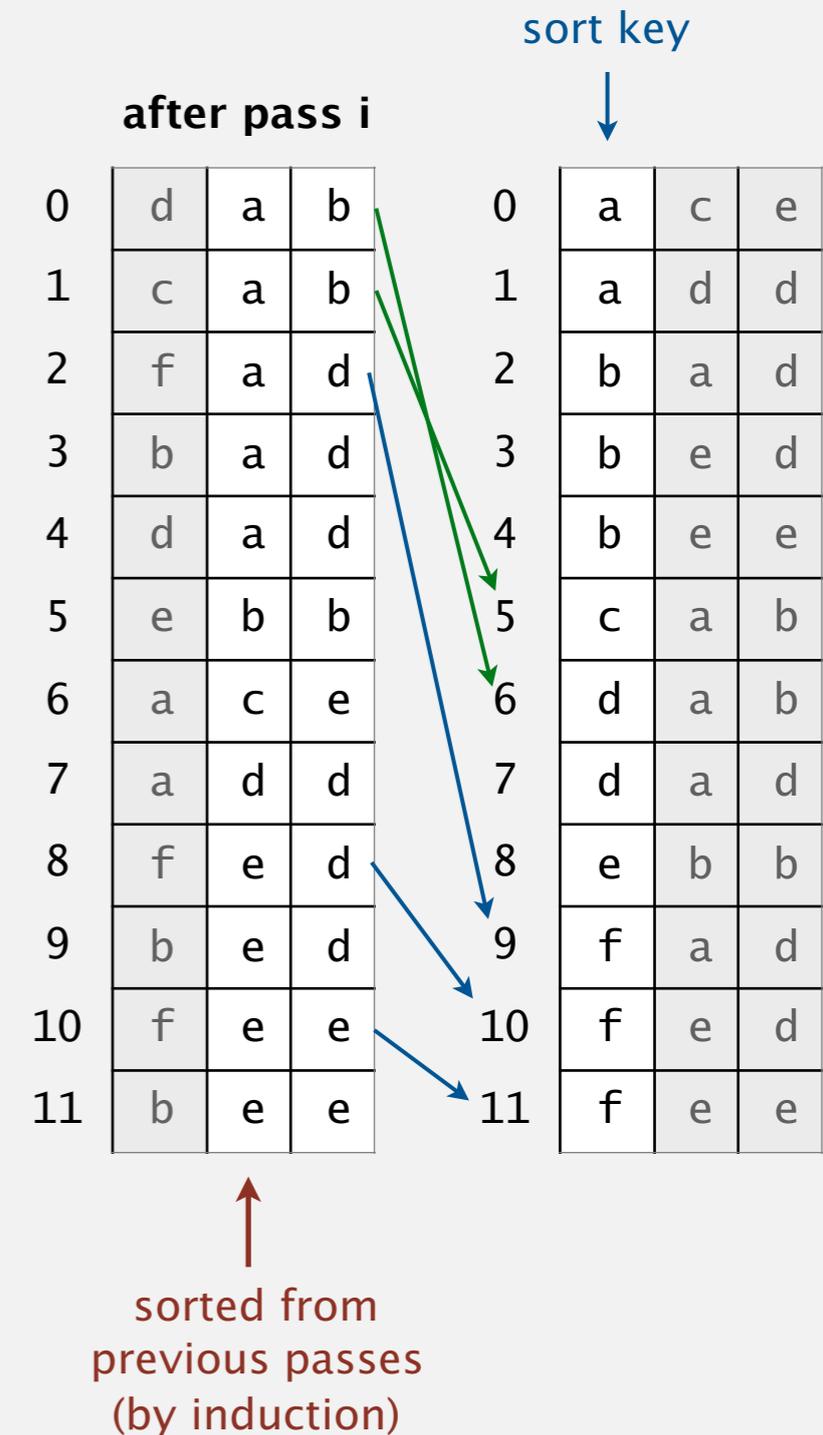

# LSD string sort: correctness proof

**Proposition.** LSD sorts fixed-length strings in ascending order.

**Pf.** [ by induction on  $i$  ]

After pass  $i$ , strings are sorted by last  $i$  characters.

- If two strings differ on sort key, key-indexed counting puts them in proper relative order.
- If two strings agree on sort key, stability of key-indexed counting keeps them in proper relative order.

**Proposition.** LSD sort is stable.

**Pf.** Key-indexed counting is stable.

# LSD string sort: Java implementation

---

```
public class LSD
{
    public static void sort(String[] a, int W)
    {
        int R = 256;
        int n = a.length;
        String[] aux = new String[n];

        for (int d = W-1; d >= 0; d--)
        {
            int[] count = new int[R+1];
            for (int i = 0; i < n; i++)
                count[a[i].charAt(d) + 1]++;
            for (int r = 0; r < R; r++)
                count[r+1] += count[r];
            for (int i = 0; i < n; i++)
                aux[count[a[i].charAt(d)]++] = a[i];
            for (int i = 0; i < n; i++)
                a[i] = aux[i];
        }
    }
}

# Reverse LSD

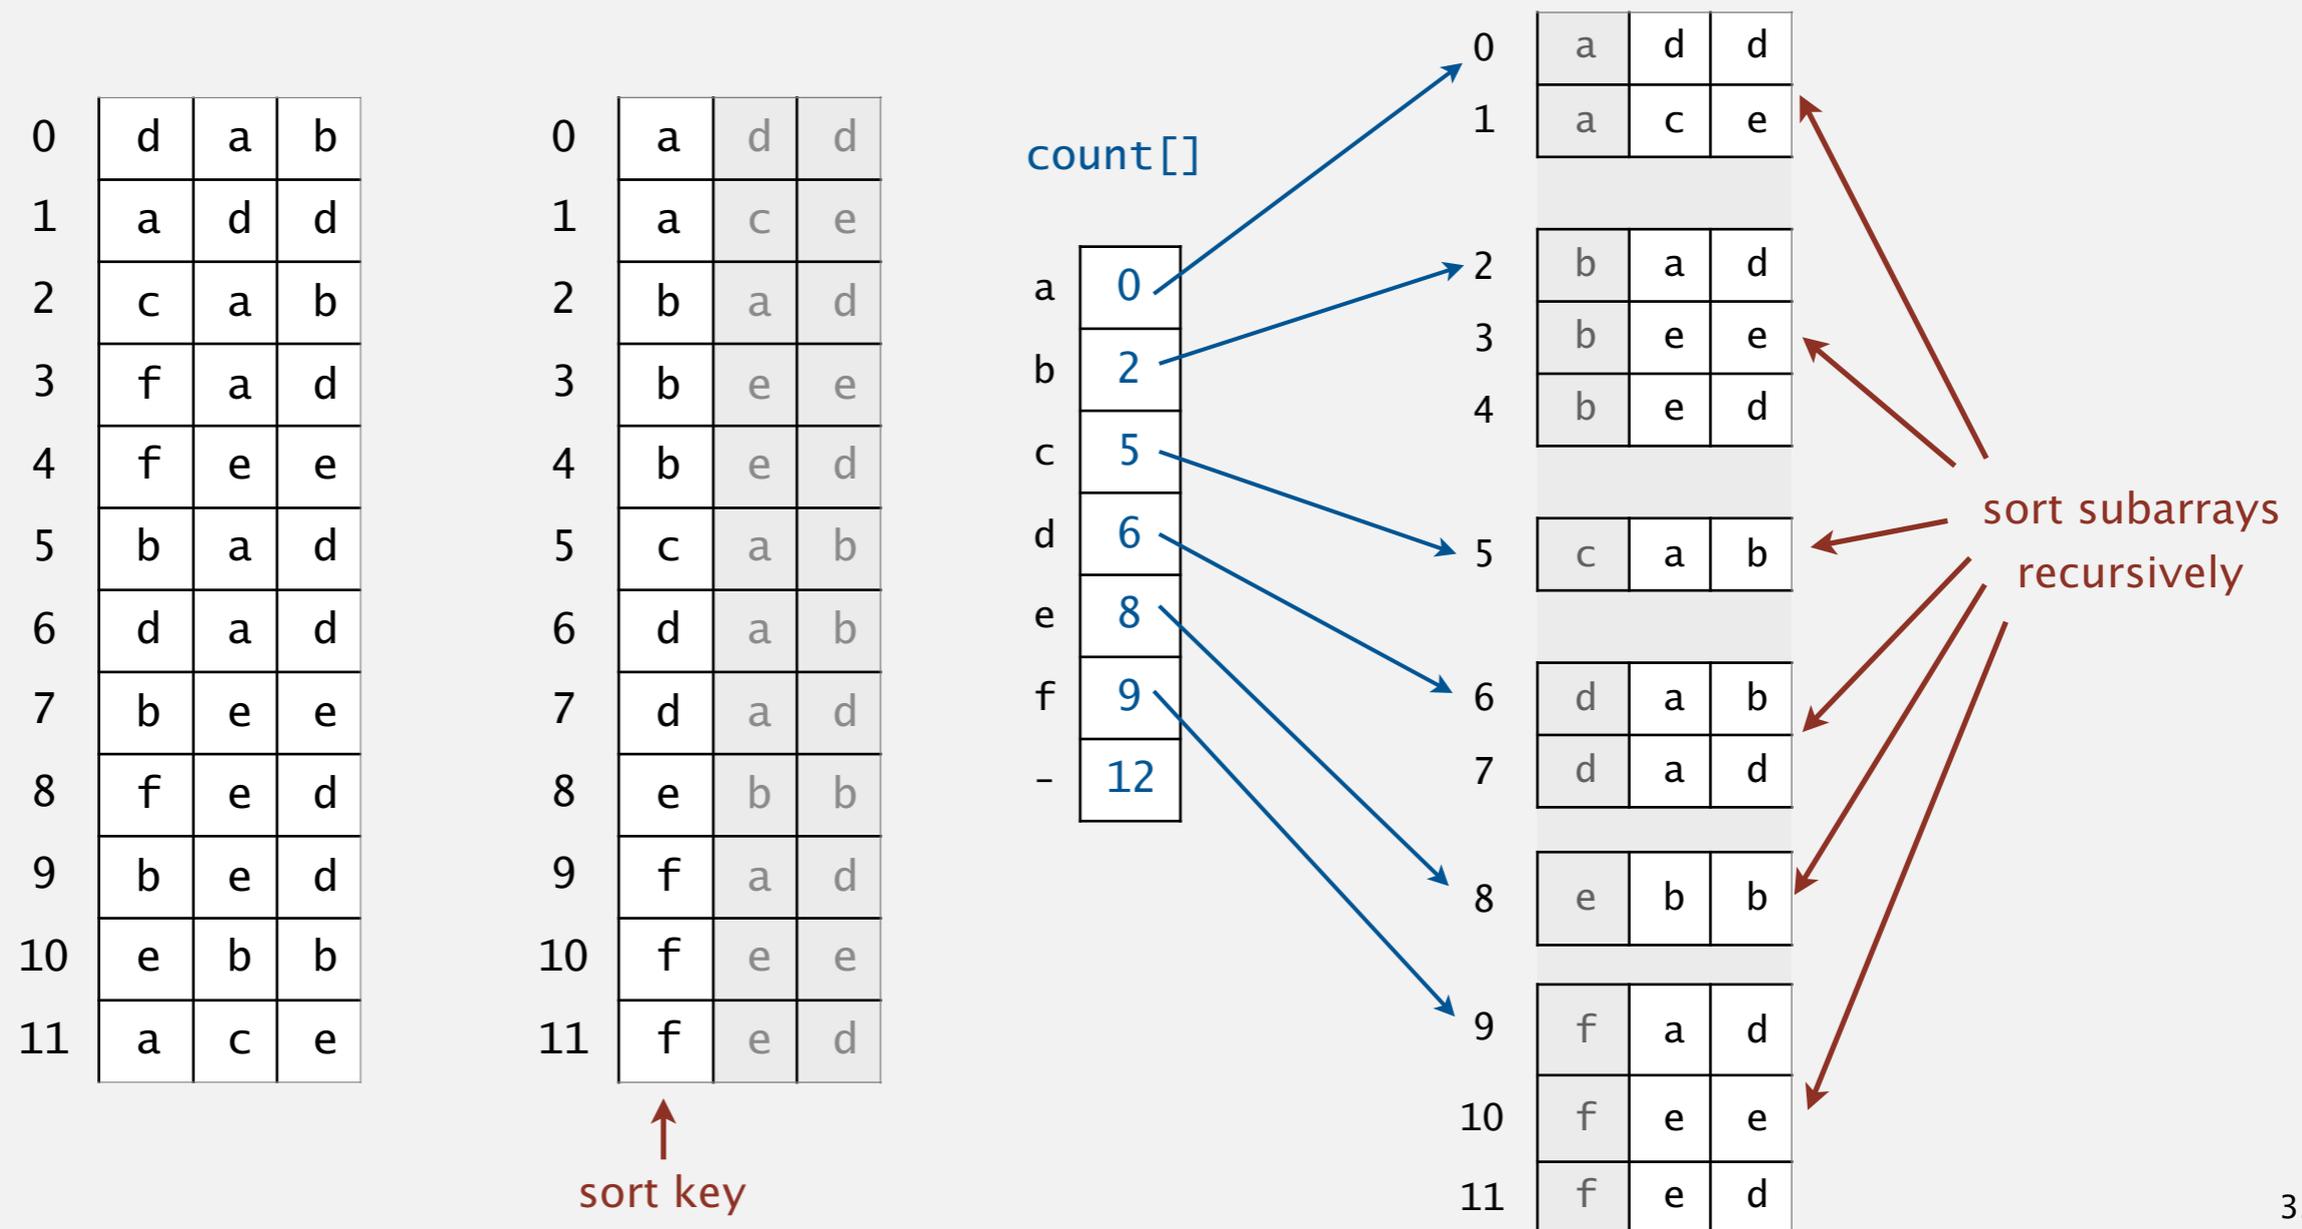

- Consider characters from **left to right**.
- Stably sort using  $d^{\text{th}}$  character as the key (using key-indexed counting).

# Most-significant-digit-first string sort

## MSD string (radix) sort.

- Partition array into  $R$  pieces according to first character (use key-indexed counting).
- Recursively sort all strings that start with each character (key-indexed counts delineate subarrays to sort).

# MSD string sort: Java implementation

```
public static void sort(String[] a)
{
    aux = new String[a.length];
    sort(a, aux, 0, a.length - 1, 0);
}

private static void sort(String[] a, String[] aux, int lo, int hi, int d)
{
    if (hi <= lo) return;

    int[] count = new int[R+1];
    for (int i = lo; i <= hi; i++)
        count[a[i].charAt(d) + 1]++;
    for (int r = 0; r < R; r++)
        count[r+1] += count[r];
    for (int i = lo; i <= hi; i++)
        aux[count[a[i].charAt(d)]++] = a[i];
    for (int i = lo; i <= hi; i++)
        a[i] = aux[i - lo];

    for (int r = 0; r < R; r++)
        sort(a, aux, lo + count[r], lo + count[r+1] - 1, d+1);
}
```

# Engineering a radix sort (American flag sort)

---

**Optimization 0.** Cutoff to insertion sort.

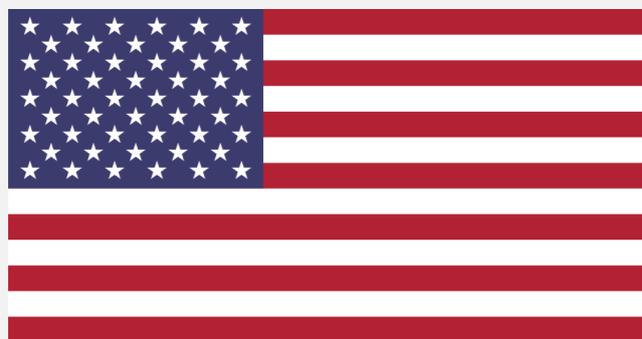

- MSD is much too slow for small subarrays.
- Essential for performance.

**Optimization 1.** Replace recursion with explicit stack.

- Push subarrays to be sorted onto stack.
- One `count[]` array now suffices.

**Optimization 2.** Do *R*-way partitioning in place.

- Eliminates `aux[]` array.
- Sacrifices stability.

American national flag problem

Dutch national flag problem

## *Engineering Radix Sort*

Peter M. McIlroy and Keith Bostic  
University of California at Berkeley;  
and M. Douglas McIlroy  
AT&T Bell Laboratories

---

ABSTRACT: Radix sorting methods have excellent asymptotic performance on string data, for which comparison is not a unit-time operation. Attractive for use in large byte-addressable memories, these methods have nevertheless long been eclipsed by more easily programmed algorithms. Three ways to sort strings by bytes left to right—a stable list sort, a stable two-array sort, and an in-place “American flag” sort—are illustrated with practical C programs. For heavy-duty sorting, all three perform comparably, usually running at least twice as fast as a good quicksort. We recommend American flag sort for general use.

---

- ▶ *strings in Java*
- ▶ *key-indexed counting*
- ▶ *LSD radix sort*
- ▶ *MSD radix sort*
- ▶ ***3-way radix quicksort***
- ▶ *suffix arrays*

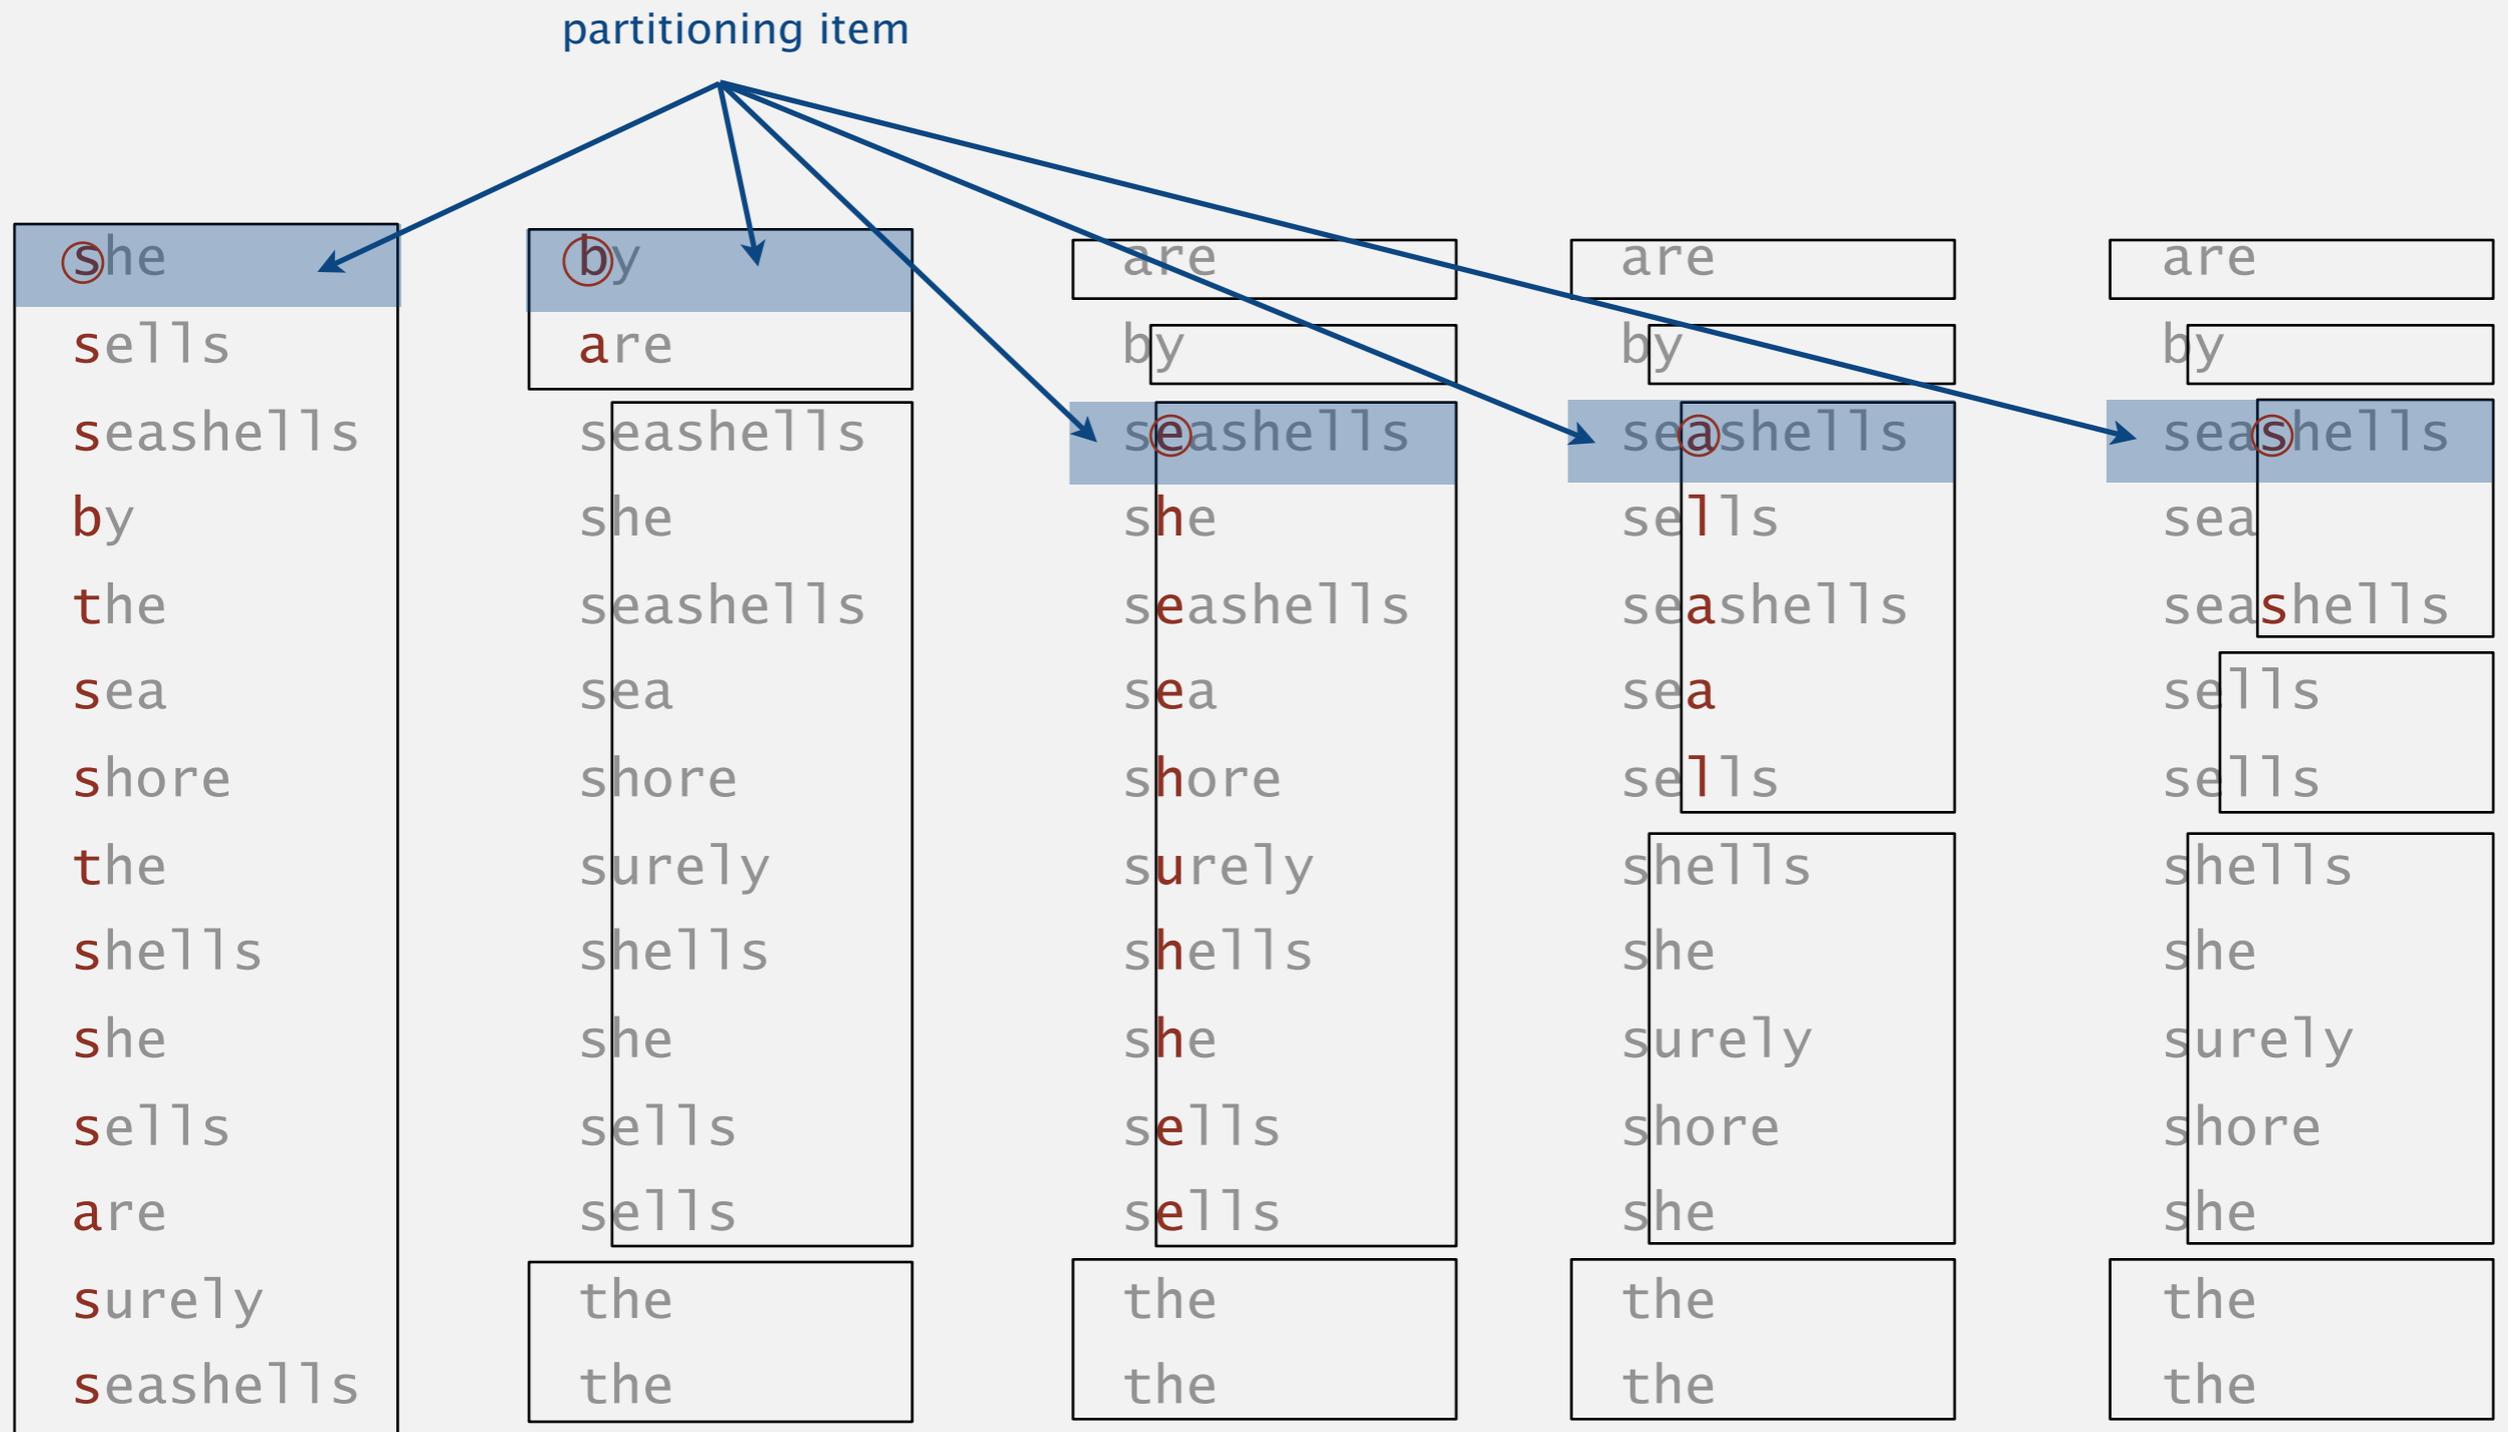

# 3-way string quicksort

**Overview.** Do 3-way partitioning on the  $d^{\text{th}}$  character.

- Less overhead than  $R$ -way partitioning in MSD radix sort.
- Does not re-examine characters equal to the partitioning char.  
(but does re-examine characters not equal to the partitioning char)

# 3-way string quicksort: trace of recursive calls

Trace of first few recursive calls for 3-way string quicksort (subarrays of size 1 not shown)

# 3-way string quicksort: Java implementation

---

```
private static void sort(String[] a)
{  sort(a, 0, a.length - 1, 0); }
```

```
private static void sort(String[] a, int lo, int hi, int d)
{
```

```
    if (hi <= lo) return;
    int v = charAt(a[lo], d);
```

```
    int lt = lo, gt = hi;
    int i = lo + 1;
    while (i <= gt)
    {
        int t = charAt(a[i], d);
        if (t < v)  exch(a, lt++, i++);
        else if (t > v) exch(a, i, gt--);
        else      i++;
    }
```

3-way partitioning  
(using  $d^{\text{th}}$  character)

```
    sort(a, lo, lt-1, d);
    if (v != -1) sort(a, lt, gt, d+1);
    sort(a, gt+1, hi, d);
```

sort 3 subarrays recursively

```
}
```

# 3-way string quicksort vs. standard quicksort

---

## Standard quicksort.

- Uses  $\sim 2n \ln n$  **string compares** on average.
- Costly for keys with long common prefixes (and this is a common case!)

## 3-way string (radix) quicksort.

- Uses  $\sim 2n \ln n$  **character compares** on average for random strings.
- Avoids re-comparing long common prefixes.

### Fast Algorithms for Sorting and Searching Strings

Jon L. Bentley\*

Robert Sedgewick#

#### Abstract

We present theoretical algorithms for sorting and searching multikey data, and derive from them practical C implementations for applications in which keys are character strings. The sorting algorithm blends Quicksort and radix sort; it is competitive with the best known C sort codes. The searching algorithm blends tries and binary

that is competitive with the most efficient string sorting programs known. The second program is a symbol table implementation that is faster than hashing, which is commonly regarded as the fastest symbol table implementation. The symbol table implementation is much more space-efficient than multiway trees, and supports more advanced searches.

# 3-way string quicksort vs. MSD string sort

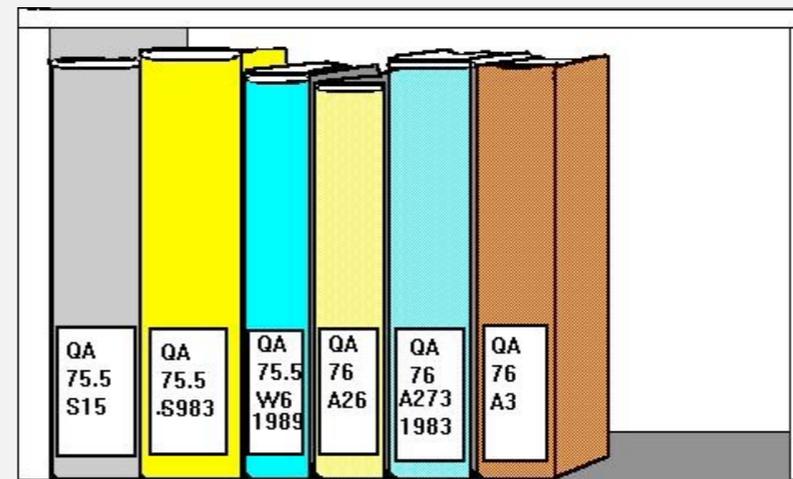

---

## MSD string sort.

- Is cache-inefficient.
- Too much memory storing count[].
- Too much overhead reinitializing count[] and aux[].

## 3-way string quicksort.

- Is in-place.
- Is cache-friendly.
- Has a short inner loop.
- But not stable.

library of Congress call numbers

**Bottom line.** 3-way string quicksort is method of choice for sorting strings.

## 5.1 STRING SORTS

---

- ▶ *strings in Java*
- ▶ *key-indexed counting*
- ▶ *LSD radix sort*
- ▶ *MSD radix sort*
- ▶ *3-way radix quicksort*
- ▶ ***suffix arrays***

# Keyword-in-context search

---

Given a text of  $n$  characters, preprocess it to enable fast substring search (find all occurrences of query string context).

```
% more tale.txt  
it was the best of times  
it was the worst of times  
it was the age of wisdom  
it was the age of foolishness  
it was the epoch of belief  
it was the epoch of incredulity  
it was the season of light  
it was the season of darkness  
it was the spring of hope  
it was the winter of despair  
:
```

# Keyword-in-context search

---

Given a text of  $n$  characters, preprocess it to enable fast substring search (find all occurrences of query string context).

```
% java KWIC tale.txt 15 ← number of characters of  
search surrounding context
```

```
o st giless to search for contraband  
her unavailing search for your fathe  
le and gone in search of her husband  
t provinces in search of impoverishe  
dispersing in search of other carri  
n that bed and search the straw hold
```

## **better thing**

```
t is a far far better thing that i do than  
some sense of better things else forgotte  
was capable of better things mr carton ent
```

**Applications.** Linguistics, databases, web search, word processing, ....

Q. How to efficiently form (and sort) the  $n$  suffixes?

```
String[] suffixes = new String[n];  
for (int i = 0; i < n; i++)  
    suffixes[i] = s.substring(i, n);  
  
Arrays.sort(suffixes);
```

3<sup>rd</sup> printing (2012)

input file	characters	Java 7u5	Java 7u6
amendments.txt	18 K	0.25 sec	2.0 sec
aesop.txt	192 K	1.0 sec	<i>out of memory</i>
mobydick.txt	1.2 M	7.6 sec	<i>out of memory</i>
chromosome11.txt	7.1 M	61 sec	<i>out of memory</i>

## How much memory as a function of $n$ ?

```
String[] suffixes = new String[n];  
for (int i = 0; i < n; i++)  
    suffixes[i] = s.substring(i, n);  
  
Arrays.sort(suffixes);
```

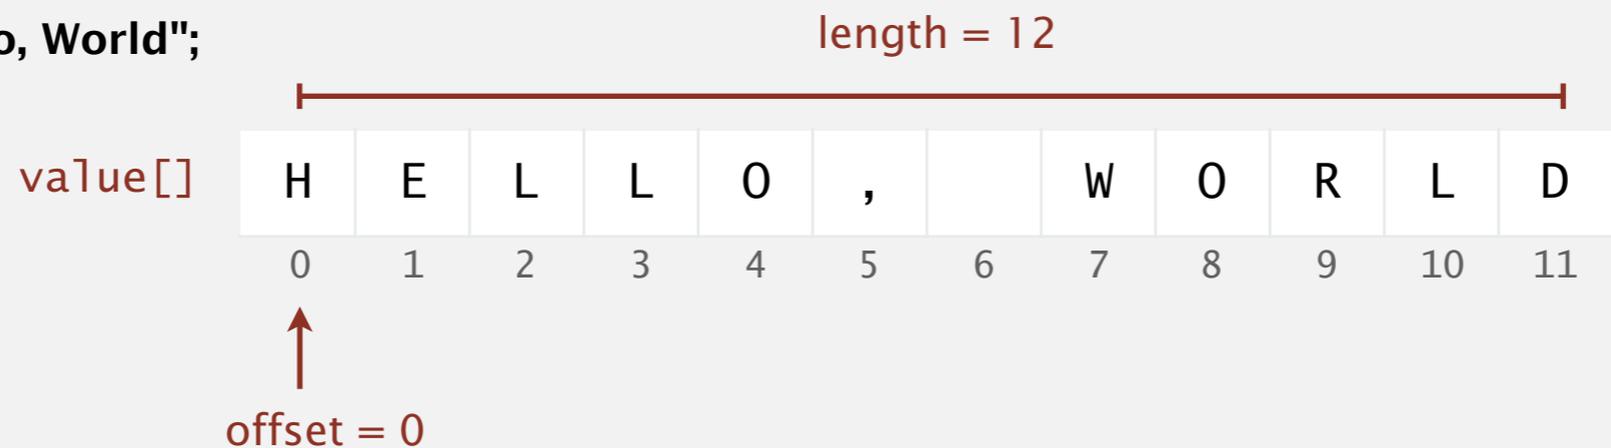

3<sup>rd</sup> printing (2012)

- A. 1
- B.  $n$
- C.  $n \log n$
- D.  $n^2$

# The String data type: Java 7u5 implementation

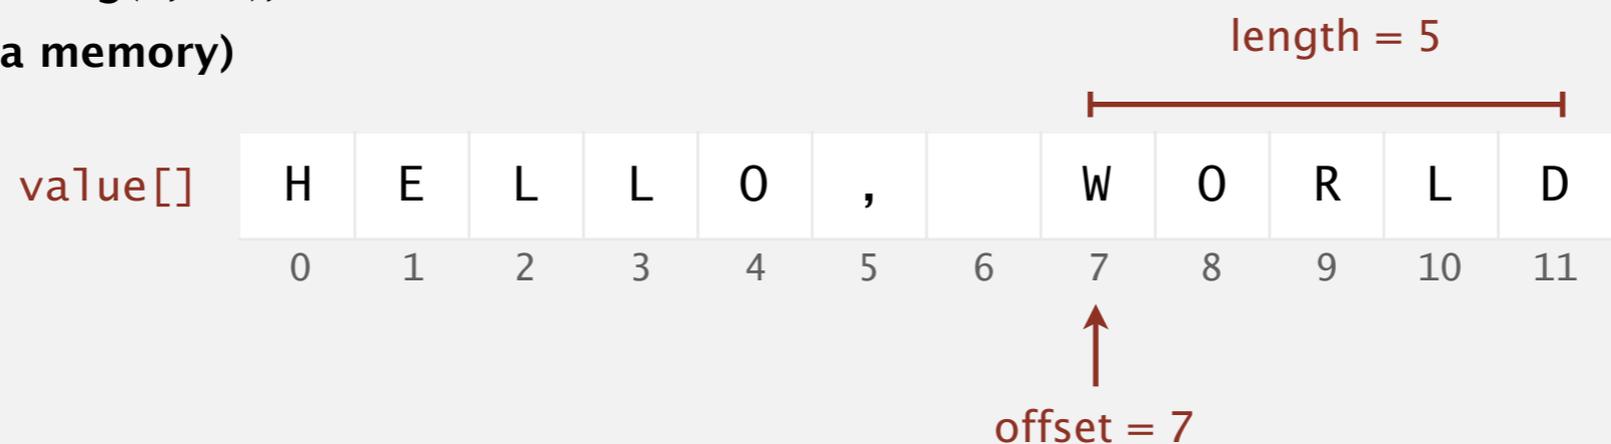

```
public final class String implements Comparable<String>
{
    private char[] value; // characters
    private int offset; // index of first char in array
    private int length; // length of string
    private int hash; // cache of hashCode()
    ...
}
```

String s = "Hello, World";

String t = s.substring(7, 12);

(constant extra memory)

# The String data type: Java 7u6 implementation

---

```
public final class String implements Comparable<String>
{
    private char[] value; // characters
    private int hash;     // cache of hashCode()
    ...
}
```

**String s = "Hello, World";**

<code>value[]</code>	H	E	L	L	O	,		W	O	R	L	D
	0	1	2	3	4	5	6	7	8	9	10	11

**String t = s.substring(7, 12);**

**(linear extra memory)**

<code>value[]</code>	W	O	R	L	D
	0	1	2	3	4

# The String data type: performance

---

**String data type (in Java).** Sequence of characters (immutable).

**Java 7u5.** Immutable `char[]` array, offset, length, hash cache.

**Java 7u6.** Immutable `char[]` array, hash cache.

operation	Java 7u5	Java 7u6
length	1	1
indexing	1	1
concatenation	$m + n$	$m + n$
substring extraction	1	$n$
immutable?	✓	✓
memory	$64 + 2n$	$56 + 2n$

# A Reddit exchange

---

I'm the author of the `substring()` change. As has been suggested in the analysis here there were two motivations for the change

- Reduce the size of String instances. Strings are typically 20-40% of common apps footprint.
- Avoid memory leakage caused by retained substrings holding the entire character array.

Changing this function, in a bugfix release no less, was totally irresponsible. It broke backwards compatibility for numerous applications with errors that didn't even produce a message, just freezing and timeouts... All pain, no gain. Your work was not just vain, it was thoroughly destructive, even beyond its immediate effect.

# Suffix sort

---

Q. How to efficiently form (and sort) suffixes in Java 7u6?

A. Define Suffix class ala Java 7u5 String representation.

```
public class Suffix implements Comparable<Suffix>
{
    private final String text;
    private final int offset;
    public Suffix(String text, int offset)
    {
        this.text = text;
        this.offset = offset;
    }
    public int length()           { return text.length() - offset; }
    public char charAt(int i)     { return text.charAt(offset + i); }
    public int compareTo(Suffix that) { /* see textbook */ }
}
```

# Suffix sort

---

Q. How to efficiently form (and sort) suffixes in Java 7u6?

A. Define Suffix class ala Java 7u5 String representation.

```
Suffix[] suffixes = new Suffix[n];  
for (int i = 0; i < n; i++)  
    suffixes[i] = new Suffix(s, i);  
  
Arrays.sort(suffixes);
```

4<sup>th</sup> printing (2013)

**Optimizations.** [5× faster and 32× less memory than Java 7u5 version]

- 3-way string quicksort.
- No String or Suffix objects.

# Suffix arrays: theory

---

**Conjecture.** [Knuth 1970] No linear-time algorithm.

**Proposition.** [Weiner 1973] Linear-time algorithms (suffix trees).

“ has no practical virtue... but a historic monument in the area of string processing. ”

## LINEAR PATTERN MATCHING ALGORITHMS

Peter Weiner

The Rand Corporation, Santa Monica, California\*

### Abstract

In 1970, Knuth, Pratt, and Morris [1] showed how to do basic pattern matching in linear time. Related problems, such as those discussed in [4], have previously been solved by efficient but sub-optimal algorithms. In this paper, we introduce an interesting data structure called a bi-tree. A linear time algorithm for obtaining a compacted version of a bi-tree associated with a given string is presented. With this construction as the basic tool, we indicate how to solve several pattern matching problems, including some from [4], in linear time.

## A Space-Economical Suffix Tree Construction Algorithm

EDWARD M. MCCREIGHT

*Xerox Palo Alto Research Center, Palo Alto, California*

**ABSTRACT.** A new algorithm is presented for constructing auxiliary digital search trees to aid in exact-match substring searching. This algorithm has the same asymptotic running time bound as previously published algorithms, but is more economical in space. Some implementation considerations are discussed, and new work on the modification of these search trees in response to incremental changes in the strings they index (the update problem) is presented.

# Suffix arrays: practice

---

**Applications.** Bioinformatics, information retrieval, data compression, ...

**Many ingenious algorithms.**

- Constants and memory footprint very important.
- State-of-the art still changing.

year	algorithm	worst case	memory
1991	Manber-Myers	$n \log n$	$8n$ ← see lecture videos
1999	Larsson-Sadakane	$n \log n$	$8n$ ← about 10× faster than Manber-Myers
2003	Kärkkäinen-Sanders	$n$	$13n$
2003	Ko-Aluru	$n$	$10n$
2008	divsufsort2	$n \log n$	$5n$ ← good choices (libdivsufsort)
2010	sais	$n$	$6n$ ← good choices (libdivsufsort)

# String sorting summary

---

We can develop linear-time sorts.

- Key compares not necessary for string keys.
- Use characters as index in an array.

We can develop sublinear-time sorts.

- Input size is number of characters (not number of strings).
- Not all of the characters have to be examined.

Long strings are rarely random in practice.

- Goal is often to learn the structure!
- May need specialized algorithms.
