COS 217, Spring 2019
Midterm Exam

This exam consists of 4 questions, and you have 50 minutes – budget your time wisely. **Do all of your work on these pages (using the back for scratch space), and give the answer in the space provided.** Assume the ArmLab/Linux/C/gcc217 environment unless otherwise stated. This is a closed-book, closed-note exam, and “cheat sheets” are not allowed. Please place items that you will not need out of view in your bag or under your working space at this time. Electronic devices such as cell phones, PDAs, laptops, MP3 players, iPods, etc. may not be used during this exam.

Name: [ ] NetID: [ ]

Precept (circle one): 1: MW 1:30 Bob Dondero 4: TTh 1:30 Xiaoyan Li
                     2: MW 3:30 Bob Dondero 5: TTh 3:30 James Heppenstall
                     3: TTh 12:30 Seo Young Kyung 6: TTh 7:30 Josh Zhang

This examination is administered under the Princeton University Honor Code. Students should sit one seat apart from each other, and refrain from talking to other students during the exam. All suspected violations of the Honor Code must be reported to honor@princeton.edu.

Write out and sign the Honor Code pledge before turning in the test:

“I pledge my honor that I have not violated the Honor Code during this examination.”

Pledge and Signature:

1. Abbreviated Arithmetic
(a) Complete the following subtraction problem on finite binary integers limited to 4 bits. (8 pts)

\[
\begin{array}{cccc}
1 & 0 & 1 & 0 \\
- & 0 & 1 & 0 \\
\hline
\end{array}
\]

(b) What is the interpretation (in decimal) of the subtraction problem (operands and result) in (a), assuming the numbers are unsigned integers? Did (unsigned) overflow occur? (8 pts)

(c) What is the interpretation (in decimal) of the subtraction problem (operands and result) in (a), assuming the numbers are two’s complement signed integers? Did (signed) overflow occur? (8 pts)

(d) What is the largest number (in binary) with which 0101 could be replaced in the subtraction above that would not lead to unsigned overflow? (5 pts)

(e) What is the largest number (in binary) with which 0101 could be replaced in the subtraction above that would not lead to signed overflow? (5 pts)
2. Entertaining Expressions

Assume that each of the following expressions is evaluated with these variables defined:

```
unsigned i = 0, j = 1;
```

Write the answer to which each expression evaluates, and the values of \( i \) and \( j \) after evaluation. If the expression results in an error, write “error” and leave the other two columns blank. Assume that the expressions are evaluated independently: changes to \( i \) and/or \( j \) do not carry over. Give all answers in decimal. The C operator precedence table is provided below. (3 pts per expression)

<table>
<thead>
<tr>
<th>Expression:</th>
<th>Result (or “error”):</th>
<th>New ( i ):</th>
<th>New ( j ):</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a) ( ++i \ &amp; \ ++j )</td>

</tbody>
</table>
3. Incorrect Insertion

We are writing code that will insert a character into a string:

/* Returns a new string consisting of string s with character c
inserted at position n. The caller owns the memory in which the new
string resides, and is responsible for freeing it. Returns NULL if
memory couldn’t be allocated, or if n is more than the length of s. */

char *strinsert(const char *s, char c, size_t n)
{
    /* Allocate space for a string with one more character */
    char *new_s = (char *) malloc(strlen(s) + 1);
    if (new_s == NULL)
        return NULL;

    /* Check if n is plausible */
    if (n > strlen(s))
        return NULL;

    /* Copy first part of s, then c, then rest of s, then null */
    memcpy(new_s, s, n);
    new_s[n] = c;
    memcpy(new_s + n + 1, s + n, strlen(s) - n);
    new_s[strlen(s) + 1] = '\0';

    return new_s;
}

Here is documentation for the standard library functions used above:

void *malloc(size_t size);
    Allocates size bytes and returns a pointer to the allocated memory.
    Returns NULL on error.

size_t strlen(const char *s);
    Returns the length of the string pointed to by s, excluding the terminating null byte.

void *memcpy(void *dest, const void *src, size_t n);
    Copies n bytes from memory area src to memory area dest.
    Returns a pointer to the destination dest.
3. Incorrect Insertion (cont.)

(a) Unfortunately, the code above has two rather serious memory-management bugs. The first bug manifests itself if \(n\) is too large. *What is the bug? Describe how to rearrange the code to fix it.* (10 pts)

(b) The second bug manifests itself if \(n\) is within range. *What is the bug? Rewrite one line of code so that it is fixed.* (10 pts)

(c) With the above two fixes, the code is correct, but it turns out that it’s inefficient. *How many times does it access each character* in the input string? (5 pts)
4. Last in the List [King, p. 454]

Given the following definition:

```c
struct node {
    int key;
    struct node *next;
};
```

Write the following function: (20 pts)

```c
/* Given a pointer to the first node in a linked list, returns a pointer to the last node whose key equals n. Returns NULL if n does not appear in the list. */

struct node *find_last(struct node *first, int n) {
```
